1. Introduction.

1.1 Background, define terms/concepts

In the era of e-commerce with rapid economic development in recent years, many sales models have emerged that provide instant interaction between sellers and consumers. Due to the growing impact of social media platforms on the daily lives of users (Sorescu et al., 2011), Live streaming services have emerged as an innovative retail method. Live streaming shopping is a relatively new e-commerce concept, and the COVID-19 outbreak has accelerated the model in several respects. It combines many platforms such as e-commerce, social networks, and entertainment livestream (Li, Wang and Cao, 2022) provides both merchants and consumers with commercial and social support through real-time and interactive communication between video creators and consumers, by allowing customers to purchase Products showcased with just a few taps on their phone while watching a live stream (Lin and Nuangjamnong, 2022a). Among them, several studies and reports have proven that live-streaming commerce will increase its capital size unpredictably (Liu et al., 2022), (Zhao and Li, 2022).

Besides pre-existing applications such as Facebook, Instagram, or Shopee, TikTok emerged quickly and attracted users with traffic on TikTok that is huge and far exceeds any other social networking application. Shopping on TikTok in China has raked in billions of dollars each year in e-commerce, and additional information shows why TikTok is more popular than other similar apps (Chan and Asni, 2022). TikTok reached 1.5 billion users in 2023, a 16% increase on the previous year, and downloads of this application more than 4.3 billion (Mansoor Iqbal, 2024). As a result, the TikTok Livestream platform has become a prominent phenomenon and the use of TikTok Livestream for shopping has become popular in recent times, especially for small

businesses that want to sell online and attract a lot of attention from Gen Z in particular – who are familiar with technology and have a need to access shopping information quickly and conveniently.

There are several advantages of Livestreaming TikTok over other forms of online shopping, such as product displays. When customers shop on Amazon or Shopee, they will judge the quality of the product based on anonymous reviews, which may be fake, and the customer has never seen the product or its real image. In livestream shopping, sellers show how to use, and test products and the benefits that products bring without having to go to the store in person (Helen Davidson, 2022). Therefore, information plays an important role in online shopping decisions, (Dwidienawati et al., 2020a) indicating that potential customers often collect useful, accurate information and make comparisons before considering a purchase. Another advantage of shopping via live streaming is better prices and many attractive offers. Research (Chan and Asni, 2022) shows that, if a certain number of people buy the same product thanks to economies of scale, customers can get a better price, which has impacted customers' livestream purchase intentions. Along with many advantages of connecting with customers, (Cynthia, 2024a), (Hanifa and Mas'od, 2024a) have added that perceived ease of use perceived usefulness, and perceived information quality also greatly influence the formation of their purchase intent.

Therefore, this study aims to explore the impacts that affect Gen Z's shopping intentions on the TikTok platform Livestream to open up a new perspective on consumer shopping behaviors in the digital age.

1.2 Objectives

Based on research by(Dwidienawati et al., 2020), the goal of this study is to find out how specific factors affect Generation Z's intention to buy the TikTok Livestream platform.

Specifically, the study focuses not only on familiar factors such as influencer endorsements and customer reviews but also expands to learn more about other important factors such as perceived ease of use, perceived usefulness, perceived information quality, and price affect the formation of purchasing behavior.

The goal of the research is to shed light on how these factors contribute to forming or hindering the purchasing intentions of Generation Z users. By analyzing these variables in depth, the research aims to provide information Insights and a clearer look at how TikTok Livestream works as an effective e-commerce tool. At the same time, the research also hopes to provide useful information to improve user experience, increase engagement, and promote the purchasing intentions of young customers on this platform. Thereby, the research contributes to a better understanding of consumer psychology and behavior in the rapidly evolving digital environment.

1.3 Research Questions

To achieve my goal, the research questions in this study have been designed to fit with the objectives, as mentioned below:

- What factors have the most significant influence on Gen Z's purchase intent on TikTok's live-streaming platform?
- How do customer reviews and influencer endorsement impact Gen Z's buying behavior on TikTok livestream?
- Why does Gen Z choose to buy through TikTok livestream instead of other platforms?
- How do price factors, quality information, and perceived ease of use affect Gen Z's purchase intent on TikTok livestream?

1.4 Gaps

To the best of my knowledge, the influence mechanism of factors such as influencer endorsements and customer reviews are documented to influence purchase intention. However, there is still a gap in understanding other factors that influence purchase intention that are still unclear, such as perceived ease of use, price attractiveness, and perceived information quality. Specifically, for Gen Z - a technology-savvy target group, the ease of use of the platform often plays an important role in increasing interaction rates and converting viewers into buyers. However, this aspect has not been thoroughly exploited in previous studies. Similarly, the appeal of low prices in live streams is influenced by competitive prices in the market and promotions and special offers of the platform, which is considered a revenue factor strong attraction but has not been widely analyzed in research articles. In addition, perceived usefulness includes the accuracy and relevance of content that is essential for purchasing decisions but has not been further exploited.

In summary, those factors have the potential to further shape Generation Z's purchase intentions on TikTok Livestream but it has not been explored much in the literature, so this study seeks to address these gaps for a comprehensive view and understanding of purchase intent on TikTok live streams.

2. Clearly define the variables relevant to the study.

2.1 Basic Theory

This study is based on the Signalling theory to understand the online purchase intent of customers in emerging markets. According to (Connelly et al., 2011) Signalling theory is useful in describing behavior when two parties (individuals or organizations) have access to different

information. Signaling theory is based on reducing information asymmetry and can thereby reduce the uncertainty arising from the product. Specifically, live-streaming e-commerce can communicate potential product information that has not yet been observed by sending observable signals to consumers. To improve signal efficiency, multiple signals are designed to transmit the same information multiple times to the consumer (Chen, Shen and Wei, 2023). Therefore, consistency between signals can affect consumer attitudes towards the product. In online shopping on live streams, potential customers face many risks and receive the uncertainty of each product. They are unable to evaluate products directly and physically compared to in-store purchases, so the availability of other stakeholders can share their experiences, reviews, and feelings about products and services to help customers have a lot of information and reduce the asymmetry of that information. This will reduce the level of risk and increase trust when customers make purchasing decisions (Dwidienawati et al., 2020a).

In addition, TAM theory is applied to predict user acceptance and highlight potential design issues before technology users interact with the system. TAM comes from the Theory of Rational Action (TRA) and has been expanded through many studies. The TAM demonstrates a pioneering research effort by creating a framework to explain the actual behavioral intent and behavior of users toward the adoption of new technology. In TAM, perceived usefulness (PU) and perceived ease of use (PEOU) are the perceptions that users hold about the system (Koul and Eydgahi, 2017). In which, (Davis, 1989)PEOU is defined as "the degree to which a person believes that the use of a particular system will require no effort" and PU is "the degree to which a person believes that the use of a particular system will enhance his or her work performance".

2.2 Conceptual model and research hypothesis

2.2.1 Purchase intention

In the context of e-commerce, purchase intent is an important factor in consumer behavior research. Purchase intention not only reflects the willingness of consumers to buy a product but is also an important forecast indicator of actual buying behavior. The definition of purchase intention is the "psychological stage" in the purchase decision-making process, which is the planning or active purchase of products by consumers(Lin and Nuangjamnong, 2022b). Purchase intent is a type of decision-making that assesses why a customer would buy a particular brand. According to (Nadia and Indri, 2024), purchase intent is the tendency to buy a brand and is usually based on the compatibility of the purchase motive with the brand's attributes or characteristics. According to research by (Dac Thanh, Bao Ngoc and Thu Trang, 2023), a customer's decision to buy a product is heavily influenced by the product's value and recommendations from other consumers, such as on social media. In this study, purchase intent is the desire to own a product after watching a TikTok live advertisement.

2.2.2 Influencer endorsement

An influencer is defined as *"a person who exhibits a combination of several desirable attributes—whether personal attributes such as charisma, expertise, or enthusiasm, or network attributes such as connected or central—allowing them to influence a disproportionately large number of others"*. Influencers are at the forefront of social trends. They are people who demonstrate expertise, prestige, and enthusiasm and have the power to influence many people. They may be early adopters or those who discover trends before anyone else and enliven them with their creativity, spreading them further on social media. They are influential in spreading

messages about new products or popularizing new trends and driving sales (Dwidienawati et al., 2020a). When a product has endorsements from influencers, it has a positive impact on consumers' purchasing intentions.

2.2.3 Customer reviews

Customer reviews are defined as peer-generated product reviews posted on a company or third-party website, including direct comments in livestream comment sections and other previous reviews of the product, which act as a source of social information and strongly influence consumer beliefs and decisions. People's purchasing decisions tend to be influenced by their interactions with others, as customer reviews can help reduce concerns about not being able to experience a product before purchasing, thereby increasing their effectiveness in decision-making (Chen et al., 2022). According to (Dwidienawati et al., 2020a), these customer reviews provide additional information, expert reviews, and personalized advice, which can bring value to potential customers. They presented evidence that 91% of participants read customer reviews before purchasing a new product or service, while 46% of participants in that study said their decisions were influenced by reviews that argument. Furthermore, seventy-seven percent of U.S. online shoppers said they use consumer-generated reviews and ratings to help them make decisions.

2.2.4 Perceived ease of use

For Generation Z, a tech-savvy consumer group, perceptions of the ease of use of the TikTok Livestream platform can influence engagement and purchase intent. A friendly and easy-to-use interface helps consumers easily access and participate in the online shopping process. PEU is an important variable that affects online shopping intention because most customers are not only interested in useful online shopping but also in easy and convenient online shopping, especially

young customers. Studies have concluded that PEU has a positive relationship with customers' behavioral intention to use (Personal RePEc Archive, Hai Thi and Thanh, n.d.). Applying the TAM model, to explore individuals' attitudes towards adopting diverse technologies, it also emphasizes the importance of perceived ease of use in predicting individuals' behavior related to the application of different technological systems. Furthermore, previous research has shown that streaming services often offer more intuitive navigation than traditional e-commerce sites, which significantly influences people's purchasing decisions consumption (Cynthia, 2024a)

2.2.5 Perceived usefulness

Perceived usefulness is an important factor in the TAM model (Technology Acceptance Model), it affects the decision to use or reject new technologies (Azizah, Nur and Putra, 2022). In the context of TikTok livestream, perceived usefulness is understood as the degree to which users perceive the platform to benefit them and includes improving their personal or work lives. Studies have showed that perceived usefulness has a positive relationship with purchase intention on livestream platforms (Lim, Yeo and Alfredo, 2021). Users watch livestreams as a modern and convenient way to simplify personal activities. At the same time, the perception of usefulness influences the intention to use the platform and is closely related to the perception of ease of use (Cynthia, 2024a).

Understanding the factors that impact perceived usefulness helps the TikTok platform target audiences more effectively and enhance the user experience.

2.2.6 Low–price appeal

Competitive prices and promotions during live streams can boost purchase intent. Although this factor has not been studied in depth in the context of TikTok Livestream, previous studies have

shown that reasonable prices combined with special promotions can create a strong incentive for consumers to make shopping behaviors. Moreover, because the setup and operation costs of a one-stop shop can be minimized, it will have a lower impact on the selling price on TikTok Livestream than traditional stores. Just setting a very competitive price will attract the attention of many consumers and greatly influence their purchase intentions (Chan and Asni, 2023).

2.2.7 Perceived Information Quality

Perceived Information Quality is very important and influential for purchase intent when shopping directly provided in livestream sessions, some of the criteria used to evaluate quality include relevance, reliability, accuracy and relevance, ease of understanding, concise, completeness, and practicality, which strongly influence customer perception and interaction in online commerce (Filieri, 2016). High-quality information helps consumers better understand products, minimize uncertainty, and increase confidence in purchasing decisions. In this study, the quality of information is perceived in the immediate interaction and sharing of product details between buyers and sellers through actual feedback on the live stream (Hanifa and Mas'od, 2024b)

2.2.8 Model

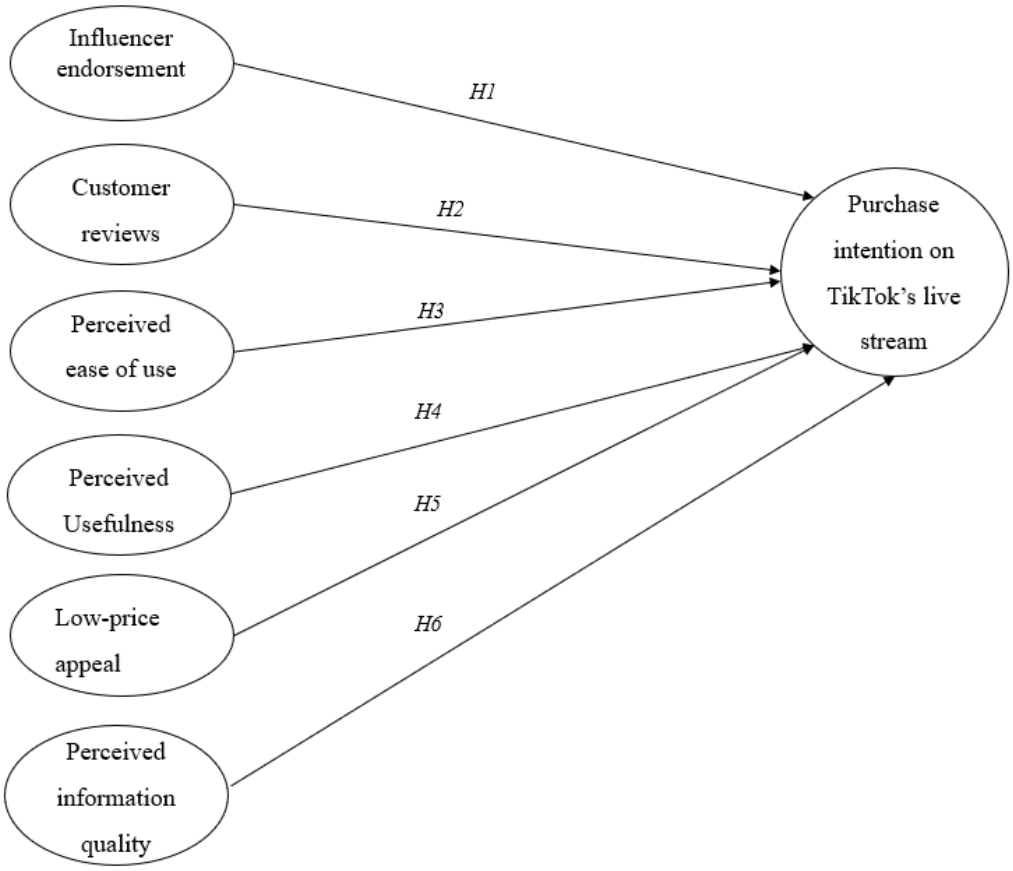

Figure 1. Research model

3. Explaining the relationship between the variables.

3.1 Method

This study uses quantitative survey methods to measure factors affecting Gen Z's purchasing intentions on the TikTok livestream platform. This method allows data collection through questionnaires, helping to collect and analyze numerical data to verify the hypotheses proposed in the research. Using quantitative methods not only helps to compare easily between variables but also aids in detecting trends and patterns in user shopping behavior. Surveys were chosen as the primary tool because of their effectiveness in reaching a large number of participants, including

users distributed across many different geographical areas. This is important to ensure the views of many members of the Gen Z generation - the main target group of the study - are fully and accurately reflected when they participate in shopping through livestreams on TikTok.

3.2 Measure

This study has seven main constructs, which are influencer endorsement, customer reviews, perceived ease of use, usefulness, low-price appeal, perceived information quality, and purchase intention. To measure the above constructs, I used a 23-item scale adapted from previous studies. Next, I developed a questionnaire that included factors, questions and references and invited instructors to evaluate the validity of each content.

Questionairs

Factors	Questions	References
Influencer endorsement	IR1: To make sure I buy the right product, I often read influencer reviews IR2: I frequently gather information from influencer reviews to help me choose the right product IR3: When I buy a product, influencer reviews make me confident in purchasing the product.	(Dwidienawati et al., 2020b)
Customer reviews	CR1: I often read customer reviews to know product impressions from others CR2: I frequently gather information from customer reviews to help me choose the right product	(Dwidienawati et al., 2020b)

	CR3: When I buy a product, customer reviews make me confident in purchasing the product.	
Perceived ease of use	PE1: The purchase process in TikTok live-streaming shopping is straightforward. PE2: The instructions in TikTok live streaming shopping are easy to follow. PE3: The overall shopping experience in TikTok live streaming is easy. PE4: It is easy to find the products I am looking for in TikTok live streaming shopping.	(Cynthia, 2024b)
Perceived usefulness	PU1: I find TikTok live-streaming shopping to be a useful way to shop. PU2: I find the products in TikTok live streaming shopping useful. PU3: The information provided during TikTok live-streaming shopping is accurate	(Cynthia, 2024b)
Low-Price Appeal	PR1: It is easily attracted by price promotions PR2: When it comes to price promotions, I cannot help buying PR3: The price promotion gave me a strong impulse to buy	(Chan and Asni, 2023)

Perceived information quality	QU1: Perceived information quality has a positive influence on purchase intention QU2: Live streaming promotion content on TikTok provides up-to-date product/service information QU3: Live streaming promotion content on TikTok provides relevant information regarding products/services QY4: I can easily get information about products/services by watching live-streaming promotions on TikTok	(Hanifa and Mas'od, 2024b) (Elsholiha, Najib and Amalia, 2023)
Purchase intention	PI1: I want to buy a product/service featured in a live-streaming promotion on TikTok PI2: It's very likely for me to buy the products/services featured in live-streaming promotions on TikTok PI3: The live demonstrations and interactive features inherent in TikTok live streaming sessions positively influence my propensity to engage in purchases.	(Elsholiha, Najib and Amalia, 2023) (Cynthia, 2024b)

3.3 Data collection

Data will be collected through an online survey using a Google Form distributed to Gen Z audiences through social media platforms and communication channels to complete during the survey. The questions are measured using a Likert scale, on a scale of 1 to 5 from "strongly

disagree" to "strongly agree" to assess the level of agreement of participants with each factor affecting influence purchase intention. In addition, my questionnaire also includes some basic questions about the demographic characteristics of Vietnamese users such as age, gender, education level, monthly income, etc. The survey process was conducted through online distribution via Facebook, Instagram, and Messenger. Data was collected through consumers in Vietnam with a total of 250 responses received for data analysis after careful screening.

3.4 Data analysis

Additionally, all collected data were analyzed using descriptive analysis and PLS with SmarPLS to determine the validity and reliability of each study indicator as well as determine the relationships between latent variables. First, analyze your sample's demographic data to determine which age groups and demographics are most interested in making purchases on TikTok Livestream. Next, analyze the index reliability, construct reliability, convergent validity, and discriminant validity of the samples to consider their appropriateness. Analyze and test structural relationships and conceptualize cause-and-effect paths. Finally, analyze the overall fit of the model, considering whether the indicators are within the recommended limits or not.

4. Result & Discussion

4.1. Descriptive statistics

Table 1 provides statistics that describe and present the demographics of the sample in detail, including gender, age, education, income, and usage of TikTok's livestreams of a given population. Of the 385 samples, 306 surveys were usable, of which 185 (60.46%) were female and 121 (39.54%) were male. This disparity may indicate that women have more interests or access to

TikTok's livestream platform; in other words, this platform is more attractive to younger women than men. It can be seen that most of the participants belonged to the Gen Z age group from 1997-2012 (91.18%), thereby showing that this livestream platform is more attractive and more suitable for the interests and needs of Gen Z youth. Moreover, in terms of education level, the number of participants with a college degree accounted for a significant proportion of 65.69% in the sample mainly students, followed by 22.88% who have graduated. The income level of the participants is quite diverse and no one income group is dominant, however, the group of respondents with a monthly income of less than 5 million VND (39.22%) and from 5-10 million VND (31.70%) accounts for a fairly high percentage, which shows that TikTok's livestream platform, is affordable and attractive to this group of people. Finally, most respondents who use the service or product regularly make up the majority (77.45%), while 22.55% do not use it regularly. These statistics have shown that the platform meets users' needs and satisfies them.

Table 1. Descriptive statistics of respondents

Measure	Value	Frequency	Percent
Gender	Female	185	60.46
	Male	121	39.54
Age	Before 1980	15	4.90
	From 1981 - 1996	4	1.31
	From 1997 - 2012	279	91.18
	Under 2012	8	2.61

Education	University	201	65.69
	College	20	6.54
	Graduated	70	22.88
	High school	15	4.90
Income	Less than 5 million VND	120	39.22
	5-10 million VND	97	31.70
	10-15 million VND	47	15.36
	Above 15 million VND	42	13.73
Usage level	Use regularly	237	77.45
	Do not use frequently	69	22.55

4.2. The measurement model

In this article, the measurement model is evaluated for the reliability and validity of the construct measures in order to eliminate weakly observed variables and only retain variables that represent well the latent variable. (Hair et al., 2017) proposed standards for reliability indicators, internal consistency reliability, convergent validity, and discriminant validity, including outer loadings, Cronbach's alpha and composite reliability. First, (Hair et al., 2017)recommend that the outer loading coefficient for the observed variable to be meaningful is 0.7 or higher. In the article, the outer loading coefficient of the measurement model in Table 2 shows reliability and validity high with all items exceeding the accepted threshold of 0.7. Constructs such as CR (Customer reviews), IR (Influencers endorsement), and PU (Perceived usefulness) perform particularly strongly, with consistent values above 0.8 for the respective items, thus confirming their relevance their strong contribution to structures. PE (Perceived ease of use) and QU (Perceived information quality) also meet the threshold, although items such as PE4 (0.708) and QU2 (0.707) are at an acceptable level, which shows that this research still has room. for refinement or reassessment in

future studies. Overall, the outer loadings confirmed the reliability of the model and all constructs demonstrated adequate associations with their items, which contributed to a strong and consistent measurement model shop.

Table 2. Outer loadings

	CR	IR	PE	PI	PR	PU	QU
CR1	0.836						
CR2	0.848						
CR3	0.861						
IR1		0.846					
IR2		0.858					
IR3		0.867					
PE1			0.741				
PE2			0.763				
PE3			0.718				
PE4			0.708				
PI1				0.735			
PI2				0.813			
PI3				0.829			
PR1					0.763		
PR2					0.800		
PR3					0.844		
PU1						0.834	

PU2						0.830	
PU3						0.855	
QU1							0.715
QU2							0.707
QU3							0.753
QU4							0.808

Besides, the measurement model demonstrates high reliability and convergent validity based on the assessment of Cronbach's alpha coefficient, composite reliability and average variance extracted (AVE). As shown in Table 3, all items with factor loadings greater than 0.6 were considered significant (Zainudin Hj Awang, 2010). Furthermore, we tested the reliability of the constructs by calculating Cronbach's alpha and Composite reliability (CR) for each construct. Cronbach's alpha values for all constructs exceeded the acceptable threshold of 0.7 and ranged from 0.704 (PI) to 0.819 (IR), indicating good internal consistency of the model. The composite reliability (both rho_a and rho_c) met above the required threshold of 0.7 indicating exceptionally high reliability across the constructs. Another standard criterion for determining convergent validity at the construct level is AVE and AVE is above the minimum required level of 0.5 (Hair et al., 2017). From Table 3, the AVE values for all constructs exceed the minimum threshold of 0.5 indicating that this construct explains more than half of the variance of its indicators. Therefore, it can be concluded that the measurements are reliable and valid (Table 4). Testing discriminant validity with the Fornell-Larcker criterion showed that the root square of the AVE of each construct was higher than the correlation with other latent constructs, demonstrating that there was discriminant validity among all constructs, which shows that all tested variables have good discriminant validity. In summary, the measurement model results show that the reliability and

validity of the constructs are satisfactory and we continue to test the structural model as proposed above.

Table 3. Construct reliability and validity

	Cronbach's alpha	Composite reliability (rho_a)	Composite reliability (rho_c)	Average variance extracted (AVE)
CR	0.806	0.811	0.885	0.719
IR	0.819	0.819	0.892	0.734
PE	0.715	0.720	0.823	0.537
PI	0.704	0.709	0.836	0.629
PR	0.726	0.734	0.845	0.645
PU	0.791	0.792	0.878	0.705
QU	0.742	0.779	0.834	0.558

Table 4. Discriminant validity (Fornell-Larcker criterion)

	CR	IR	PE	PI	PR	PU	QU
CR	**0.848**						
IR	0.390	**0.857**					
PE	0.253	0.150	**0.733**				
PI	0.286	0.441	0.369	**0.793**			
PR	0.383	0.395	0.323	0.620	**0.803**		
PU	0.446	0.348	0.459	0.579	0.663	**0.840**	

QU	0.523	0.472	0.332	0.575	0.662	0.602	**0.747**

4.3. The structural model

Before testing the hypotheses, we tested for colinearity between the constructs using Collinearity statistics (VIF) values. According to (Sohil, Sohali and Shabbir, 2022), if VIF is greater than 5, there is a problem. As shown in Table 5, since all VIF values are below the threshold of 5, colinearity between constructs is not a significant issue in this analysis.

Table 5. Collinearity statistics (VIF) – Inner model

	VIF
CR -> PI	1.482
IR -> PI	1.356
PE -> PI	1.279
PR -> PI	2.237
PU -> PI	2.227
QU -> PI	2.308

The structural equation model is the second step of PLS data analysis that was used to test the research hypotheses of the model. It examines the relationship between constructs and their impact on Purchase intention (PI), we use path coefficients, t-values and p-values as meaningful indicators.

Based on table 6 below, the Influencer endorsement factor ($\beta = 0.162$, $p = 0.003$) has a positive impact on PI. This reflects the growing impact of influencers in shaping purchasing decisions, especially through trust and relatability. This result has made similar observations to the

study of (Dwidienawati et al., 2020b) . Both of these articles show that a person with a high number of followers and social influence will have their message conveyed to a large number of customers on the platform. Authenticity is key to being able to connect with consumers with a broad reach. When the majority of consumers like their posts, it will positively influence the opinions of other followers and stimulate their purchase intentions.

However, the research article by (Dwidienawati et al., 2020b) shows that Customer reviews ($\beta = -0.045$, $p = 0.722$) do not affect purchase intention, but in My research has shown that Customer reviews have a negative impact ($\beta = -0.122$, $p = 0.014$, $f = 0.020$). and has a small impact on Purchase intention. This negative impact not only does not promote customers' purchase intention, but also reduces it because they do not feel convinced or deterred by the negative information in those reviews. Negative elements from CR will prevail over other positive elements (PR, PU or QU) in the consumer's mind and create a large "minus point". Like the previous study, he also stated that the information that participants received from customer reviews did not seem to be very reliable, which means that most participants only agreed a little that they trust customer reviews.

Low-appeal Price ($\beta = 0.288$, $p = 0.000$) has a significant positive impact and is the most important factor affecting Purchase intention. This finding is similar to previous research by (Chan and Asni, 2023). People often tend to be attracted by great promotion codes, thousands of hot deals along with reasonable prices of each product on TikTok's livestream platform will strongly boost consumers' purchasing intentions. Thereby emphasizing the importance that businesses should focus on competitive, transparent pricing strategies, providing discounts or promotional incentives to create the feeling of affordable prices, especially in low-cost markets. markets where consumers

are very price sensitive. Even when prices are attractively low, they become more attractive and can motivate purchases by emphasizing the value for money aspect.

Along with Perceived usefulness ($\beta = 0.203$, $p = 0.002$) is positively and strongly related to purchase intention. This result emphasizes consumers' preference for products or services that provide clear and tangible benefits. It is consistent with established behavioral theories such as the Technology Acceptance Model (TAM), in which perceived usefulness directly impacts acceptance and purchase behavior. The findings show that when consumers perceive TikTok live streaming as useful for meeting their needs and preferences, they are more inclined to purchase. This finding is consistent with previous research by (Cynthia, 2024b) , which has also emphasized the importance of usefulness in influencing consumers' purchase intentions. in the field of e-commerce and online shopping. The significant and favorable impact of Perceived usefulness on purchase intention underscores the fundamental importance of perceived value in shaping consumer behavior in the TikTok livestream purchasing environment. Thereby, marketers should clearly communicate information about the actual benefits of products through advertisements or testimonials, for example proving that the products solve real problems of consumers. consumers or enhance consumer experiences to promote perceived usefulness and lead to increased purchase intention.

Perceived information quality ($\beta = 0.195$, $p = 0.000$) has a positive impact on purchase intention. This finding highlights the importance of accurate, clear, and trustworthy sources of information in reducing uncertainty and increasing consumers' confidence in their purchasing decisions. This supports previous research by (Elsholiha, Najib and Amalia, 2023). Both studies show that high-quality information helps reduce ambiguity, increase trust and boost consumer purchase intentions. However, in the study of (Elsholiha, Najib and Amalia, 2023), perceived

information quality does not directly affect purchase intention but is determined through the mediation of Attude toward Ads. This means that in livestream QU not only affects purchases but also creates trust and positive attitudes of consumers in advertising and sellers (Trust in Seller and Trust in Platform). In my article, QU has a direct effect on PI, reflecting that in the context of this study, trustworthy and useful information can immediately and directly promote purchase intention without must go through any intermediary steps such as the attitudes and beliefs of the seller or advertising.

Finally, Perceived ease of use ($\beta = 0.119$, $p = 0.023$, $f = 0.022$) has a positive and significant influence on purchase intention but with a small effect size. While ease of use is important, its impact is secondary to other factors such as price and usefulness. The notable and positive impact of ease of use on purchase intention in shopping environments TikTok's livestream highlights the role of user-friendly interfaces and intuitive navigation in shaping behavior consumer purchases. Analysis results show that our data are still similar to that of the study (Cynthia, 2024b) . Findings show that consumers are more likely to engage in purchases when they find livestream shopping platforms easy to use and navigate. This PE can play a supporting role, enhancing the overall user experience and helping to reduce potential friction in the purchasing process. Furthermore, the link between purchase intent and ease of use suggests that improving user experience, simplifying navigation, and optimizing the purchasing process can lead to increased conversion rates and sales number. Therefore, to respond, businesses should focus on designing intuitive interfaces, and streamlined and shortened processes so that users can easily access them.

Table 6. Summary of hypothesis tests						
Hypotheses	**Original sample**	**Sample mean**	**Standard deviation**	**T statistics**	**P values**	**f-square**
H1: IR -> PI	0.162	0.161	0.055	2.961	0.003	0.056
H2: CR -> PI	-0.122	-0.121	0.050	2.469	0.014	0.020
H3: PE -> PI	0.119	0.125	0.052	2.278	0.023	0.022
H4: PU -> PI	0.203	0.201	0.064	3.156	0.002	0.037
H5: PR -> PI	0.288	0.285	0.065	4.451	0.000	0.075
H6: QU -> PI	0.195	0.200	0.055	3.525	0.000	0.033

Table 7. R-square		
	R-square	**R-square adjusted**
PI	0.503	0.493

In Table 7, the R=square value (0.503) indicates that 50.3% of the variance in Purchase Intention is explained by six predictor variables (IR, CR, PE, PU, PR, QU). This is a moderate level of explanation, demonstrating the model's ability to capture many, but not all, of the key determinants of purchase intention. Therefore, the ability of exogenous variables to explain endogenous variables is moderate.

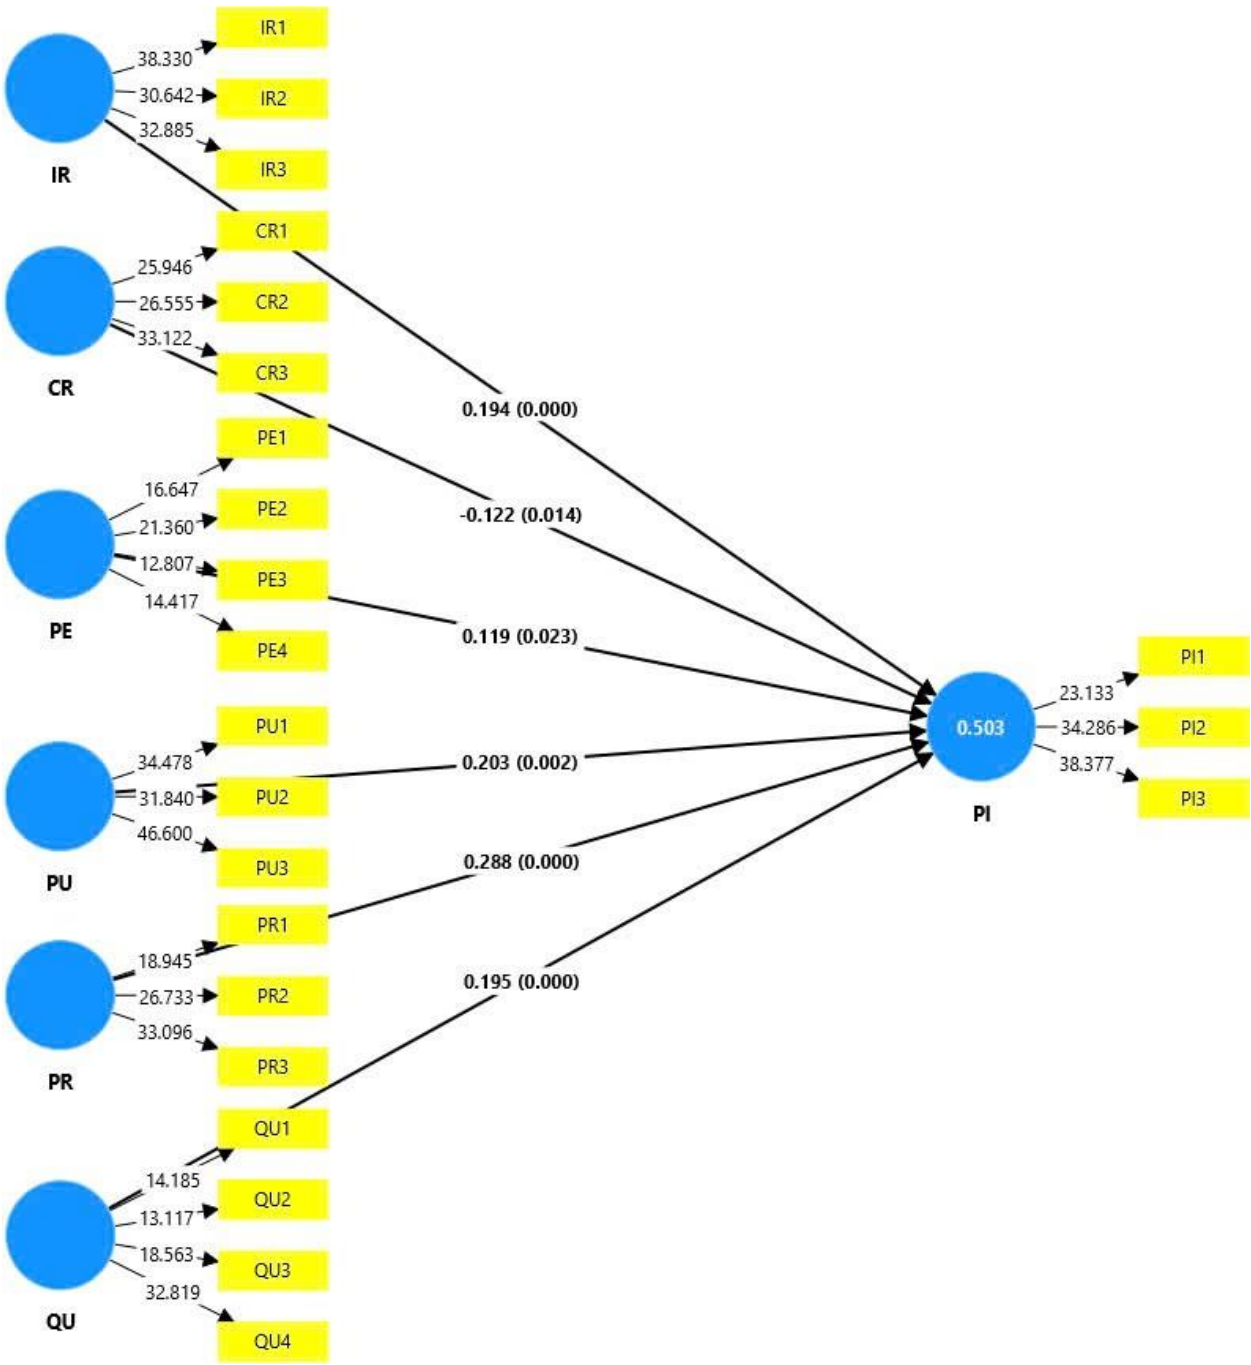

Figure 2. Results of the structural model

5. Conclusion

5.1. Summary findings

The main purpose of this study is to analyze Gen Z's purchase intention on TikTok's livestream platform and identify its determinants, we have considered the relevant variables in the Technology Acceptance Model (TAM) and identify variables related to Signaling theory that can directly or indirectly drive Gen Z's purchasing intentions today on TikTok's livestream platform. By applying SEM to sample data of 306 people, the key constructs in TAM include Perceived usefulness which is one of the important predictors for driving Gen Z's purchase intention and Perceived ease of use also contributes part reinforces its role as a supporting factor rather than the main driving force. Besides, Low-appeal price is the factor predicted to have the most influence on purchase intention, emphasizing the important role of competitive and affordable prices in promoting consumers' purchasing decisions use. Likewise, Influencer endorsements also demonstrate the growing importance of authenticity and social proof in shaping consumer behavior on interactive platforms like TikTok. These results are also consistent with (Dwidienawati et al., 2020b; Chan and Asni, 2023; Cynthia, 2024b). On the contrary, Customer reviews show a small but negative impact, reducing purchase intention, different from research by(Zainudin Hj Awang, 2010; Hair et al., 2017; Dwidienawati et al., 2020b; Sohil, Sohali and Shabbir, 2022; Chan and Asni, 2023; Elsholiha, Najib and Amalia, 2023; Cynthia, 2024b). Along with that, Perceived information quality also does not need to go through an intermediary variable but it can directly affect purchase intention, unlike research by (Elsholiha, Najib and Amalia, 2023). This study suggests that information can indirectly affect purchase intention through trust from the seller or advertising. Therefore, my research paper contributes to this research field by adding the impact of these two factors on Gen Z's purchase intention on TkTok's livestream.

5.2. Implications

From a theoretical perspective, this study contributes to the growing body of knowledge on consumer behavior, especially in the context of Generation Z's purchase intentions on TikTok's live shopping platform. The findings confirm the importance of the constructs and highlight the direct role of Perceived usefulness, Perceived information quality and Low-appeal price in directly influencing purchase intention. Furthermore, this research highlights the unique and growing role of influencer endorsements and their ability to shape purchasing behavior through trust and social proof. The study also shows that the negative impact of customer reviews can outweigh other positive influences and highlights the important role of trust in shaping Gen Z's purchasing behavior.

In fact, businesses should focus on providing clear benefits and competitive pricing to attract Gen Z. Accurate and trustworthy information should be prioritized to build trust and increase revenue. Strengthening connections and partnerships with influential people can really increase social trust. In addition, businesses need to manage their reputation through negative reviews to increase customer stimulation and purchase intention. Ultimately, increasing the seamless and user-friendly experience on TikTok's livestream platform is essential to meet Gen Z's expectations to drive greater engagement and purchase intent.

5.3. Limitation and future research

The current study has several limitations that require future research. First, my sample focuses primarily on Gen Z users, which may limit the generalizability of other findings to Gen X, Gen Y, Gen Alpha age groups or other contexts. other culture. Therefore, future research needs to expand more demographic diversity to obtain more in-depth information. Second, while the study

examined six main factors, other potential variables such as emotional engagement, social norms, or gamification elements in livestream shopping were not explored. Future research should incorporate these factors to provide a more comprehensive understanding of consumer behavior. Third, this study is based on a cross-sectional design that should capture consumer behavior at a single point in time and may not take into account changes in preferences or habits over time. Therefore, future studies that may study vertically can provide deeper insights into the evolving factors influencing purchase intent on TikTok's livestream platform. Finally, it is possible to generalize the research model to new technology mobile applications, emerging countries, and different consumer groups. Uncovering these drivers will provide businesses with actionable insights to keep consumers engaged.
