DETERMINANTS OF TRAVEL DESTINATION CHOICE INTENTION AMONG VIETNAMESE TOURISTS: THE CASE OF HOI AN WORLD CULTURAL HERITAGE SITE

BY

VAN THI THU HUONG

Graduation Project Submitted to the Department of Business Studies, HELP University, in Partial Fulfilment of the Requirements for The Degree of Bachelor of Business (International Business) Hons

DECEMBER 14, 2025

DECLARATION

I hereby declare that the graduation project is based on my original work except for quotations and citations, which have been duly acknowledged. I also declare that it has not been previously or concurrently submitted for any other course/degree at HELP University or other institutions. The word count is 11771 words.

VAN THI THU HUONG

Date: 14/12/2025

ACKNOWLEDGEMENT

I would like to express my sincere gratitude to all those who have accompanied, supported and encouraged me during the implementation of this course.

First of all, I would like to express my deep gratitude to Assoc. Prof. Nguyen Ngoc Duy Phuong, the instructor, has wholeheartedly instructed, oriented professionally, and always patiently given me suggestions from the initial ideas to the completion of the topic. Without the close guidance of the teacher, it is difficult for me to complete the thesis course on schedule and with the current quality.

Next, I would like to sincerely thank all the teachers of HELP University and University of Finance and Marketing (UFM), as well as Ms. Sumathi (Lecturer of MGT400), for teaching and equipping me with a foundation of knowledge and research methods throughout the learning process. I would also like to thank the teachers and school staff for creating conditions for me to participate in the program, broaden my perspective and practice the necessary skills to be able to carry out this topic.

Finally, I would like to sincerely thank all the brothers/sisters and friends who enthusiastically participated in answering the questionnaire, as well as my family and loved ones who always quietly supported and encouraged me mentally during the implementation of the project. The cooperation, trust and encouragement of everyone are a great source of motivation for me to overcome difficulties and persist in pursuing the topic until the last minute.

I am extremely appreciative and grateful for all the contributions, whether direct or indirect, of everyone to this small research work.

DETERMINANTS OF TRAVEL DESTINATION CHOICE INTENTION AMONG VIETNAMESE TOURISTS: THE CASE OF HOI AN WORLD CULTURAL HERITAGE SITE

BY

VAN THI THU HUONG

DECEMBER 2024

Supervisor: Assoc. Prof. Nguyen Ngoc Duy Phuong

ABSTRACT

In the context of Vietnam's tourism recovering strongly after the pandemic and Hoi An being continuously honored on international rankings, it becomes urgent to understand the factors that govern domestic tourists' intention to choose destinations. This study aims to identify and measure the impact of six factors – Destination Image, Destination Features, Tourism Infrastructure, Perceived Behavioral Control, Economic Concerns and Social Influences on the intention of Vietnamese tourists to choose Hoi An, based on the theory of Planned Behavior (TPB). The topic "Determinants of Travel Destination Choice Intention Among Vietnamese Tourists: The Case Of Hoi An World Cultural Heritage Site" was conducted by the author, a student at the University of Finance and Marketing. The main research method used in this topic is quantitative research**.** The data were collected via a structured questionnaire, with 433 valid samples, and analyzed using the PLS-SEM model. The results of the research provide more valuable information for the locality and contribute useful information to local authorities and businesses in the development strategy in Hoi An.

1 CHAPTER 1: INTRODUCTION

1.1 Background

1.1.1 Global scope:

In a world of change, tourism is a key driver of the global economy and an activity of profound international importance. Tourism contributes to GDP growth, supports job creation directly and indirectly, and promotes the development of related industries such as transportation, hospitality, gastronomy, and culture (John Fletcher et al., 2013). Recent studies have focused on travel destination choice intention or behavioral intention as an important factor for planning tourism marketing strategies, destination management, and sustainable tourism development. (Le & Le, 2018) study "A state-of-the-art review of tourist decision-making literature" evaluates how decision-making is influenced through tourism marketing channels. Competition among travel destinations is increasing due to many emerging destinations as well as changing travel trends, where travelers are increasingly interested in experience, destination image, infrastructure, social influence, cost control and economic concerns. Typical behavior theories such as the Theory of Planned Behavior (TPB) also show that intrinsic factors such as Attitude, Perceived behavior control and Subjective norms (Ajzen, 1991a) and external factors such as destination image, economic, infrastructure, destination features and social influence have a significant influence on shaping behavioral intentions in general. including the intention to choose tourist destinations in many countries (LE et al., 2023; Mutinda & Mayaka, 2012; Seyidov & Adomaitienė, 2017a). The author decided to choose the topic: “Determinants of travel destination choice intention among Vietnamese tourists: The case of Hoi An World Cultural Heritage Site”.

1.1.2 Vietnamese scope:

Vietnam is one of the prominent tourist destinations in Southeast Asia with great potential for cultural heritage, nature, cuisine and a strong wave of domestic tourists after the pandemic. Hoi An is a World Cultural Heritage Site with its ancient town, traditional architecture, river landscape, indigenous culture, craft villages, and cuisine as an attractive destination for both international and domestic tourists (Toan Duc Le & Phan Thanh,

2019). (Toan Duc Le & Phan Thanh, 2019) identified that tourism products and safety factors play an important role in the formation of Hoi An heritage destinations. In addition, Ha Nam Khanh (2018) has said that the connection between tangible and intangible cultural heritage is very unique. Hoi An is a "living museum" that creates outstanding and global values. However, besides the advantages of heritage value, to continue to attract tourists and especially Vietnamese tourists with plans, it is necessary to understand the factors affecting the intention to choose Hoi An as a destination, such as perceived behavior control, economic concerns, social influence, and the relative influence of each of those factors. Therefore, it is necessary to study the factors affecting the intention of Vietnamese tourists to choose Hoi An destinations, to provide scientific evidence for policy making, improving competitiveness and sustainable tourism development.

1.1.3 Overview of Tourism in Vietnam

In more than three decades of Doi Moi and international integration, tourism has become one of Vietnam's key economic sectors, making an important contribution to GDP growth and the process of restructuring the economy towards services. According to forecasts, by 2024, the tourism industry is expected to contribute more than 6.4% of national GDP, which reflects the growing role of the service industry in the economic structure. Despite being heavily affected by the COVID-19 pandemic, which has disrupted the growth of international visitors, since Vietnam reopened its borders in March 2022, the tourism industry has shown clear signs of recovery (Minh Ngoc Nguyen, 2025).

According to (Viet Nam National Authority of Tourism, 2025), in terms of market size, the number of international visitors increased from 250 thousand (1990) to 2.1 million (2000) and 5 million (2010), breaking through in the period 2015–2019: 7.9 million (2015), nearly 13 million (2017), 15.5 million (2018) and 18 million (2019). According to UN Tourism, Vietnam’s average tourism growth rate of 22.7% over this period is among the highest worldwide. Tourism revenue increased from 355 trillion VND (2010) to 755 trillion VND (2019), contributing about 9.2% of GDP before the epidemic. Despite the disruption and heavy impact of COVID-19, the reopening of borders from March 2022 has triggered a strong recovery: welcoming 3.7 million international visitors (2022) and soaring to 12.6 million (2023) and 17.6 million (2024), recovering equivalent

to ~98% of 2019 levels; in the first 7 months of 2025, it will reach 12.2 million, exceeding the same period in 2019. Remarkably, data from UN Tourism reported that Vietnam recorded growth of around 30% in the first quarter of 2025, the highest among countries in the Asia–Pacific region.

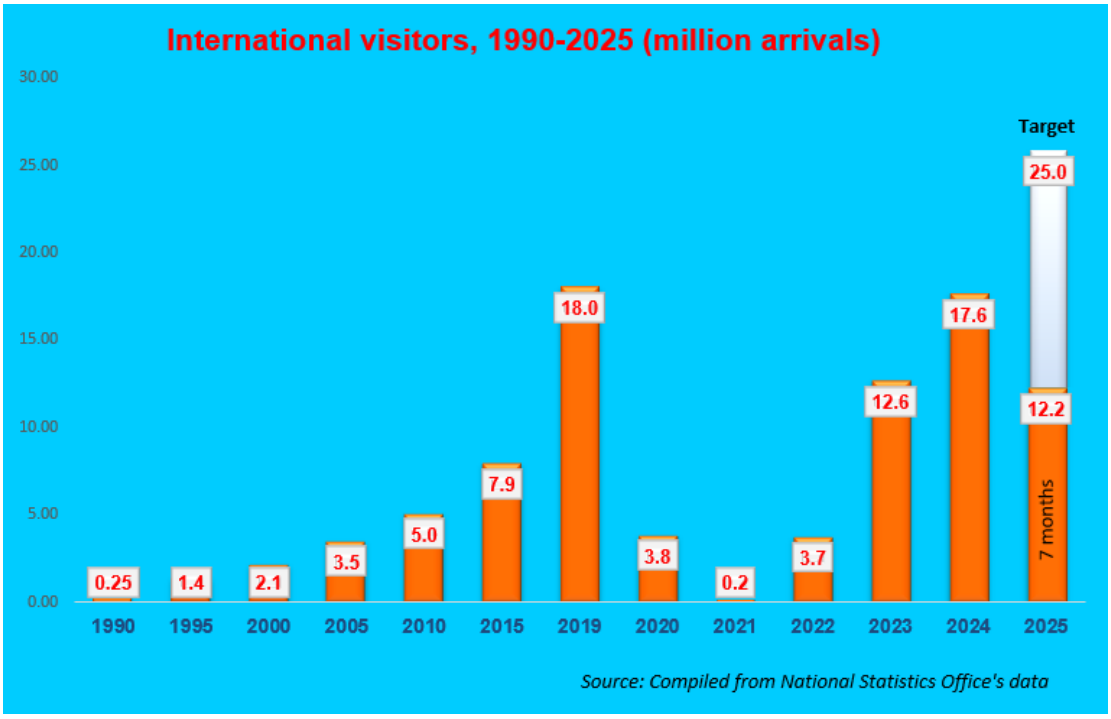

Figure 1. The number of international visitors from 1990 to 2025

The domestic market has also expanded spectacularly, playing a solid foundation, from 1 million trips (1990) to 11 million (2000), 28 million (2010), and 85 million (2019). During the international lockdown due to the pandemic, the domestic stimulus program helped the industry survive. In which, domestic tourism reached 101.3 million (2022), surpassing the pre-pandemic record and continuing to grow to 108 million (2023) and 110 million (2024); In the first 7 months of 2025 alone, 93 million trips were recorded and are forecast to continue to increase further thanks to national events.

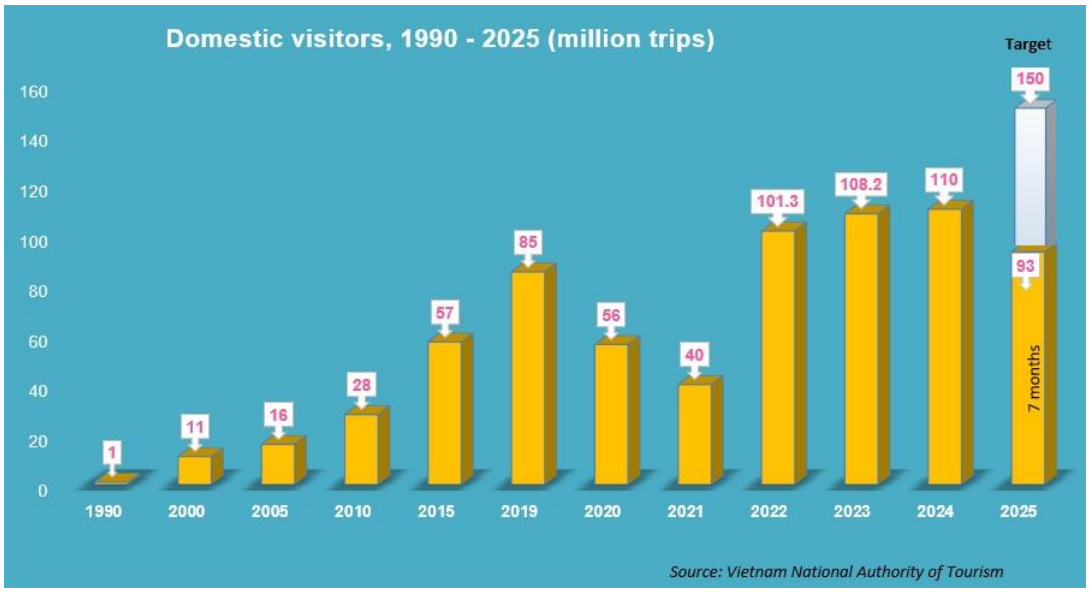

Figure 2. The number of domestic visitors from 1990 to 2025

Overall, the 35-year journey of Vietnam's tourism is a story of resilience and adaptability: from a strong domestic foundation to an impressive international recovery, tourism is affirming its role as a growth engine and a cultural "ambassador" of the country.

1.2 Problem statement

Although there is extensive research on the factors that influence the decision to choose Hoi An as a tourist destination, few studies focus specifically on Vietnamese tourists. Important factors such as destination image, perceived behavior control, economic concerns, tourism infrastructure, destination features, and social influence can influence destination intent to a different extent than research in an international context or other well-known destinations.

In addition, there is a research gap in analyzing the impact of factors such as perceived behavior control, economic concerns or social influence on Vietnamese tourists, which have different socio-cultural characteristics compared to other regions as well as international visitors. The lack of specific understanding of the role and impact of each of these factors has limited the ability to develop appropriate policies, marketing strategies and destination management orientations for Hoi An, especially for domestic tourists. Moreover, in the context of Vietnam's specific tourism culture, endogenous factors such

as the impact of family, friends or mass media may play an important role but have not been comprehensively analyzed in previous studies.

1.3 Research objectives

The objective of this study is to contribute to filling the theoretical and practical gap in the intention of Vietnamese tourists to choose tourist destinations for Hoi An. Specifically, a study focuses on:

- Identify internal and external factors that influence Vietnamese tourists' intention to choose a tourist destination in Hoi An ancient town (such as destination image, destination features, perceived behavior control, economic concerns, tourism infrastructure, and social influence).
- Clarify the roles and impacts of those factors on tourists' intentions
- Measure the relative impact to determine which factors have the strongest impact and which still require improvement.
- Discuss practical recommendations to enhance Hoi An's attractiveness to Vietnamese tourists, especially those who intend to choose Hoi An as the first or main destination in their travel itinerary.

1.4 Research questions

To achieve the objective, the research questions in this study have been formulated to align closely with the stated aims, as outlined below:

- What factors have the most significant influence on the intention of Vietnamese tourists to choose Hoi An as a tourist destination of Vietnamese tourists?
- How do perceived behavior control, economic concerns, and tourism infrastructure affect intentions, strongly or weakly?
- Why is it important to understand how these factors affect Hoi An's destination marketing and management strategy?
- How do outstanding features, destination image, and social influence of Hoi An shape tourists’ intention?

1.5 Scope of the study

Research object: Determinants of travel destination choice intention among Vietnamese tourists: The case of Hoi An World Cultural Heritage Site

The research scope of the project is determined to be concentrated in Hoi An Ancient Town, Quang Nam Province, Vietnam, one of the prominent World Cultural Heritage destinations.

The study subjects are Vietnamese tourists who are able or intend to choose Hoi An as a destination in their travel itinerary, even those who have been to Hoi An.

The study focuses on six key factors that can influence destination intent, including: *destination image* (Cognitive - Emotional), *destination features* (Heritage, Food, Festivals), *tourism infrastructure* (Transportation, Facilities), *perceived behavior control, economic concerns, and social influence*.

In terms of timing, the study is implemented in a certain period (from September to November 2025) in line with the data collection and processing plan. However, remains constrained by several limitations, namely that it only focuses on surveying travel intentions and does not directly reflect their actual behavior. In addition, data collected primarily through questionnaires based on travelers' self-reports, subjective biases may exist, and the scope of the study sample may be limited to certain regional or age groups. At the same time, exogenous factors such as tourism policies, socio-economic situation, or epidemics can affect research results but are difficult to control completely.

1.6 Significance of the study

a. Theoretical significance

Contributing to expanding the understanding of the factors that determine the intention to choose a tourist destination in the context of domestic tourists in Vietnam, especially for heritage destinations such as Hoi An.

Combining perceived behavior control and external factors (economic, social influence, and infrastructure) in the same analysis model helps to assess the relative impact of each factor.

Provides additional empirical evidence for theories in tourism, such as the Theory of Planned Behavior, the theory of destination image, and studies related to social influence and economic concerns for travel behavior.

b. Practical significance

The research results help local authorities and tourism service enterprises better understand the strengths and weaknesses of tourism activities or products to attract Vietnamese tourists, thereby planning effective promotion strategies, improving the quality of tourism products, improving infrastructure, and adjusting financial and communication policies accordingly.

c. Focus resources on the most influential factors to optimize investment efficiency.

Assist in designing tourism programs and products in line with the wishes and perceptions of domestic tourists, thereby increasing the number of tourists who intend to choose Hoi An, especially those who have not yet arrived or have not decided on a specific destination for their trip.

1.7 Structure of the study

The study consists of 5 chapters as follows:

Chapter 1: Research introduction

Chapter 2: Literature review

Chapter 3: Research design

Chapter 4: Data analysis

Chapter 5: Discussion and conclusion

2 CHAPTER 2: LITERATURE REVIEW

2.1 Key concepts

2.1.1 Tourism

According to the Eurostat (the Statistical Office of the EU), tourism means "*The activity of visitors taking a trip to a main destination outside the usual environment, for less than a year, for any main purpose, including business, leisure or other personal purpose, other than to be employed by a resident entity in the place visited*" (Noroozi, 2020).

According to the UNWTO, they define "*Tourism is a social, cultural and economic phenomenon which entails the movement of people to countries or places outside their usual environment for personal or business/professional purposes. These people are called visitors (which may be either tourists or excursionists; residents or non-residents), and tourism has to do with their activities, some of which involve tourism expenditure*." (UNWTO, 2010).

2.1.2 Tourists

According to (UNWTO, 2010), a tourist is a domestic, inbound or outbound visitor whose trip includes either an overnight stay or a same-day visit (or excursion).

(Yu et al., 2012) define tourists by the main purpose of the trip as entertainment, travel distance, and frequency of return to the same place, while tourists who visit friends and relatives do not.

According to ("Luật Du Lịch Số 09/2017/QH14," 2017): Domestic tourists are citizens of Vietnamese nationality and foreigners residing in Vietnam traveling within the territory of Vietnam.

However, in this study, within the scope of Vietnamese tourists, tourists who are domestic citizens and persons of Vietnamese nationality traveled to Hoi An for the purpose of tourism for at least 24 hours and not more than three consecutive months.

2.1.3 Tourism Destination

A tourism destination is "*a physical space with or without administrative and/or analytical boundaries in which a visitor can spend an overnight. It is the cluster (co-location) of products and services, and of activities and experiences along the tourism value chain, and a basic unit of analysis of tourism. A destination incorporates various stakeholders and can network to form larger destinations. It is also intangible with its image and identity, which may influence its market competitiveness*." (UNWTO, 2019).

In the context of increasing competition between destinations, today's travel trend is not just about exploring famous landmarks but also seeking unique experiences, locality, cultural interaction, sustainable tourism, and responsible tourism. The study "Beyond static rankings: A tourist experience-driven approach to measure destination competitiveness" by (Chen et al., 2025) emphasizes that destination management needs to shift from a static approach to a focus on visitor experience, adaptability over time, and individual needs to maintain destination competitiveness.

2.1.4 Definition of customer behavior intention

In behavioral studies, behavioral intention (BI) is considered the most important intermediate variable in many models for predicting behavior, especially in the Theory of Reasoned Action (TRA) and the Theory of Planned Behavior (TPB). BI is seen as a bridge between psychological and social factors (attitudes, social norms, cognitive control) and actual behavior. According to in Theory of Planned Behavior (TPB), behavioral intent reflects the individual's level of motivation to perform the behavior and represents the level of effort the individual is expected to expend to achieve that behavior. (Martin Fishbein & Icek Ajzen, 1975) defines BI as "*A behavioral intention, therefore, refers to a person's subjective probability that he will perform some behavior*"; however, some scholars argue that this approach is more about "expectation" than "intention" (Anderson, 1983).

However, later studies propose to understand BI in the original sense of the word "*intend"* in the Webster dictionary, which (Warshaw & Davis, 1985) refers to "to have in mind as a purpose; plan to do, use, give, etc.". From there, they define BI explicitly as the degree to which an individual has formed a conscious plan to perform or not perform a

particular behavior in the future. As such, behavioral intention is both a subjective probability and reflects conscious behavioral commitment, and is considered the most important intermediate indicator for predicting actual behavior (Ajzen, 1991; Martin Fishbein & Icek Ajzen, 1975).

2.1.5 Hoi An

Located on the central coast of Vietnam, Hoi An is one of the most worth visiting cities as it possesses traditional architecture present through every house, tile roof and brick. Unlike other big cities such as Hanoi or Ho Chi Minh City, Hoi An is smaller and boasts the incredible charm of previous centuries. Hoi An was recognized as a UNESCO World Cultural Heritage Site (1999) for its intact preservation of a small-scale trading port that operated from the 15th to the 19th centuries, where trade was extensive with Southeast Asia, East Asia and the rest of the world. The town reflects the outstanding value of cultural exchanges between locals and foreigners, mainly Chinese and Japanese culture, and the traditional urban architecture of wood and brick (UNESCO, n.d.). Hoi An was fortunate to escape major destruction during the two wars and to avoid large–scale urbanization in the late twentieth century. Beginning in the 1980s, its architectural and cultural heritage gradually gained recognition among scholars and tourists, turning the small town into a major attraction for visitors across Vietnam (TRUONG et al., 2021).

Hoi An features typical Tangible Cultural Heritages, including the Japanese Bridge Pagoda, Tan Ky Ancient House, Phùng Hưng, Quân Thắng, Quảng Đông (Guangdong) Assembly Halls, Phúc Kiến (Fujian) Assembly Halls. Also, there are the Museum of Trade Ceramics, the Museum of Folk Culture, Thanh Ha pottery village, and Kim Bong carpentry village. Besides religious and artistic architectural monuments, the Spiritual Cultural Value and diversified Intangible Cultural Heritages that have existed for ages through the generations on the Cham Islands, including daily life, customs and habits, religious activities, folk art, and local cultural festivals, have been conserved originally. Featured such as Hát Ru, Điệu Hò, Lý, Múa Đèn (Lantern Dance), Lễ Cầu Tế (Sacrifice Ceremony), The Fishing Festival, Bài Chòi, Tug of War, and Boat Race (Hoi An World Cultural Heritage Conservation Center, n.d.).

Figure 3. Hoi An ancient town (Tourism Information Technology Center, 2024)

Hoi An Ancient Town is continuously highly regarded as one of the most attractive places for tourists worldwide. Hoi An ranked 2nd out of 25 destinations worldwide as the World's Trending Destinations in the Travelers' Choice Best of the Best 2023 (Tourism Information Technology Center, 2024). In 2024, the ancient city of Hội An was named the No. 1 place in the Top Best-Value Destination in the World by The Post Office UK (Việt Nam News, 2024). In 2025, Hội An was ranked sixth among the top 10 cities in the world by the leading global travel and lifestyle magazine Travel+Leisure (THUY DUNG, 2025).

2.2 Theoretical Frameworks

2.2.1 Theory of Planned Behavior

The Planned Behavior Theory (TPB) developed by Ajzen (1985, 1991) represents theoretical models in studying human behavior to explain and forecast human behavior in specific contexts. According to the research of Ulker-Demirel & Ciftci (2020), they said that: "*TPB is a causal model to explain behavior, and behavioral intention is partially determined by the structure of attitude (Ajzen, 1991), and intention is a leading predictor of behavior*". The core of TPB holds that an individual's intention to perform an act is the most direct and powerful premise leading to whether or not the person actually performs the act. This intention is determined simultaneously by three components: attitude to

behavior, subjective norms, and cognitive behavioral control (PBC). In other words, if we know how positive or negative an individual's attitude is, we can predict their intention to perform their behavior. TPB is built by extending the Theory of Reasoned Action by adding the Perceived Behavioral Control (PBC) variable to the model to account for factors beyond volition that can influence intention and behavior (e.g., cost, time, infrastructure), thereby overcoming TRA's limitations in contexts of involuntary behavior (Ulker-Demirel & Ciftci, 2020). (Ajzen, 1991a) explains that the addition of PBC helps the model explain behaviors that are not entirely under the voluntary control of the individual. Therefore, TPB overcomes the limitations of TRA by covering the aspect of "can be done or not" and not just "want or don't want" a behavior.

In terms of structure, TPB includes all components of TRA (attitudes and subjective standards) and adds PBC that co-affects behavioral intentions and then actual behavioral forecasting intentions. The relative importance of each component can vary according to each situation and the types of behaviors and populations studied. (Ajzen, 1991a; Montano & Kasprzyk, 2002)

TPB was judged to be particularly relevant to the study of destination selection travel behavior. The reason is that travel decisions are often planned and are simultaneously influenced by personal factors (attitudes of travelers), social factors (influences from friends, family, society) and control factors (constraints or practical conditions such as costs, time), all of which are reflected in the TPB model. As a result, TPB has become one of the most applied models in visitor behavior research today (Ulker-Demirel & Ciftci, 2020). Many studies confirm the simplicity, generality and predictive power of TPBs in explaining travel intentions and behaviors (Ulker-Demirel & Ciftci, 2020). For example, the study by Lam & Hsu (2006) applied TPB (with the integration of past behavior variables) to predict a traveler's intention to choose a travel destination and gave positive results: attitudes, PBCs, and past experiences were strongly correlated with travelers' travel intentions. These results highlight the important role of personal attitudes toward the destination and a sense of control (e.g., whether travelers feel they are qualified to make the trip) in shaping travel decisions.

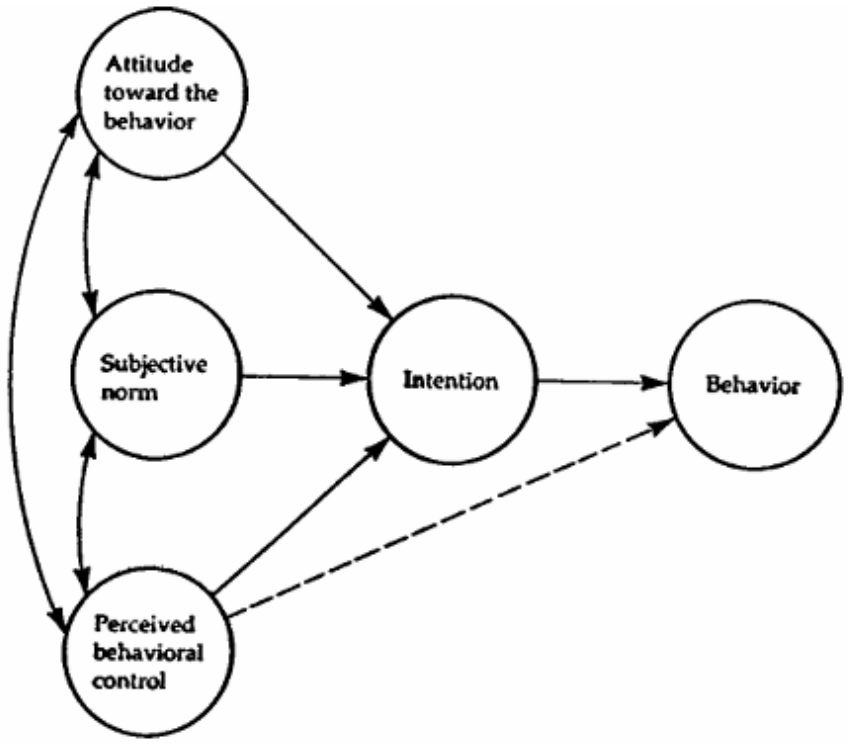

Figure 4. The Planned Behavior Theory (TPB) model

2.3 Factors influencing the intention to choose a tourist destination

2.3.1 Destination image

Destination image is understood as a traveler's overall perception of a place that they have not or have not lived, it is formed from the beliefs, ideas and impressions they have about that destination. Destination image is a multi-dimensional concept, often divided into cognitive image – understanding and belief about the destination, affective image – emotions and attitudes towards the destination, and conative image – the tendency to act in relation to the destination. A positive destination image is often associated with travelers' sympathy and good attitude towards the destination, thereby promoting higher intention to choose the destination.

Many academic studies have shown that destination images are one of the key factors that govern travelers' travel decisions. Specifically, compelling images have a significant influence on travelers' behavioral intent, including the intention to choose a destination and the intention to return or recommend the destination to others.

For instance, a meta-analysis by Afshardoost & Eshaghi (2020) of 87 studies found that destination imagery plays a significant role in forecasting travelers' intended behavior, with the overall visual and emotional aspects having the greatest impact. In other words, a destination that is positively perceived in terms of landscape, culture, people, etc., increases the likelihood that travelers intend to visit or recommend that destination to others. This implies that a destination is positioned with a unique, attractive image that will create a strong motivation for travelers to choose that destination. Conversely, if the destination has a blurry or negative image (e.g., lack of safety, boredom), visitors may hesitate or refuse to plan a visit. Therefore, tourism managers often see building and promoting attractive destination images as a strategic tool to attract tourists and promote positive tourism behavior.

H1: Destination image has an impact on travel destination choice intention

2.3.2 Perceived behavior control

Perceived behavioral control refers to the degree to which an individual believes he or she can control and perform desired behavior. According to (Ajzen, 1991) PBC is one of the three factors that directly govern behavioral intention in the TPB model, which is a person's perception of the abilities and resources available to them to carry out that behavior. In the context of tourism, cognitive behavior control is expressed in whether travelers find it easy or difficult to plan and execute a trip. For example, travelers will self-assess their ability to make a trip based on available conditions, such as whether they have enough finances, time, health, and the necessary conditions to travel or not. This factor is largely subjective because of the same destination, but each person will have a different sense of control over their trip (people with high income and extensive travel experience will find it easier than people with low or little experience). If travelers find that they have the ability and resources, such as money, time, health, legal paperwork, etc., they will be more confident and their intention to make the trip will be stronger. On the contrary, if they feel that there are too many difficulties hindering, such as a lack of money, inability to arrange time, health concerns, etc., their intention to travel will decline. (LE et al., 2023)

H2: Perceived behavior control has an impact on travel destination choice intention

2.3.3 Economic concerns

The economic concern factor refers to travelers' concerns and concerns about the financial aspects of traveling, such as the cost of the trip, the price of services, their personal budget or disposable income. This is one of the key factors that influence the decision to choose a destination and especially for price-sensitive travelers. A study by Mutinda & Mayaka (2012) on Kenya's domestic tourism found that "economic concerns" are among the most important factors that guide people's choice of travel destinations. Similarly, many other travel studies also confirm that price and affordability have a significant impact on travelers' destination decisions. According to economic laws, tourism demand tends to decrease when the cost of trips rises beyond the affordability of tourists. Many studies have proven the inverse relationship between cost and destination decision, that is, the more expensive the destination, the more likely travelers are to consider more carefully or choose alternative destinations that fit their budget and make the intention to choose less, especially for travelers who are often price-sensitive. For example, Morey et al (1991) found a negative impact of costs (travel prices, on-site service prices) on travelers' choice of destination. However, it's also worth noting that "value for money" is often more important than the absolute price (Ćulić et al., 2021). This means that if travelers feel that the experience at the destination is worth the money, they are willing to accept the high price (Morey et al., 1991). In fact, in a period of economic instability, tourists are more interested in optimizing costs – they will prioritize destinations or travel product packages that bring high value and good promotions. In short, economic factors (price, cost) are always present in the minds of tourists and strongly influence the intention and choice of travel destinations.

H3: Economic concerns have an impact on travel destination choice intention

2.3.4 Tourism infrastructure

Tourism infrastructure refers to the material and technical conditions for tourism at the destination, such as transportation systems (roads, airports, vehicles), accommodation facilities (hotels, homestays, villas, motels), restaurants and culinary services, medical services, entertainment facilities, etc tourist information center and utilities to serve visitors. The quality of infrastructure at the destination directly affects the

guest experience: good infrastructure helps tourists access the destination easily, move conveniently and feel safer and more comfortable during the trip (Ćulić et al., 2021). Studies show that improved infrastructure contributes to improving visitor satisfaction, thereby indirectly driving the intention to return and introduce the destination later (Mutinda & Mayaka, 2012). On the contrary, if the infrastructure is weak (difficult traffic, lack of accommodation, limited medical services, etc.), that destination will be less attractive in the eyes of tourists even though it has unique natural or cultural resources. Indeed, destinations with well-developed infrastructure are often highly valued and prioritized by tourists. Therefore, a tourist locality with a convenient transportation network, many quality hotels, and thoughtful tourism services will be easier to attract tourists than one where infrastructure is lacking, helping to increase the competitiveness of the destination and positively impact the intention of tourists to visit.

H4: Tourist infrastructure has an impact on travel destination choice intention

2.3.5 Destination features

Destination features include the attributes and characteristics of the destination both naturally and culturally and are the core attractive factors that attract tourists, often referred to as pull factors in the tourism engine model (Mutinda & Mayaka, 2012). Typical characteristics are a set of natural and human attributes inherent to a place (natural resources, climate, coastline, landscape; heritage-culture-history; cuisine, lifestyle; leisure activities; atmosphere) that help create its own attraction and shape the choices of visitors.

The role of destination characteristics in tourism intentions is very clear; if the destination possesses many attractive characteristics and is suitable for the interests and needs of tourists, they will want to experience that place even more. (Crompton, 1979) research shows that factors such as landscape beauty, pleasant climate, and rich cultural values are strong motivators for tourists to choose destinations. The survey results in Kenya also show that the top factors that attract tourists include unique natural scenery, beautiful weather, fresh environment, historical sites, etc., and all of them are specific destination characteristics (Mutinda & Mayaka, 2012). Similarly, in other contexts, the set of attributes such as a fresh environment, unique landscapes, rich heritage and culture,

good accommodation and culinary services consistently appear in the group of important criteria when considering destination selection (Buhalis, 2000; Jansen-Verbeke, 1986). Therefore, tourist destinations with attractive characteristics will create a competitive advantage, increasing the sympathy and intention of tourists to visit. On the contrary, if that destination lacks highlights or nothing outstanding, it will be difficult to be on the list of tourists' choices.

H5: Destination features have an impact on travel destination choice intention

2.3.6 Social influence

Social influence is defined as the degree to which an individual perceives that significant others believe they should use or decide something, and that these influences are integrated from other similar architectures, including subjective norms (developed from TRA models, TAM2, TPB/DTPB, and C-TAM-TPB) (LE et al., 2023). In the context of tourism, it reflects the extent to which the impact of those around them, such as family, friends, colleagues, and public opinion, on the perception and intention of travel of individuals. This element is similar to the concept of subjective norms in TPB, which talks about the pressure or expectations from "important people" that the individual feels in relation to whether or not to perform the behavior. Therefore, when travelers receive support from social networks, the intention to choose a destination increases; conversely, unfavorable signals will reduce the likelihood of intention formation (Ajzen, 1991). In the context of tourism, it reflects the extent to which the impact of those around them such as family, friends, colleagues, and public opinion on the perception and intention of travel of individuals. This element is similar to the concept of subjective norms in TPB, which talks about the pressure or expectations from "important people" that the individual feels in relation to whether or not to perform the behavior; Therefore, when travelers receive support from social networks, the intention to choose a destination increases; conversely, unfavorable signals will reduce the likelihood of intention formation.

In addition, for tourism, Word-of-mouth (WOM) and eWOM through social networks or community promotion are considered a strong source of information and influence. Therefore, the quality and reliability of travel information on social media will have a positive impact on travel intentions (Wang & Yan, 2022). Besides, Tsai & Bui

(2021) has also demonstrated that eWOM also has significant effects on intent, which can increase the benefits of sourcing information about travel using social media. In addition, "bandwagon effects" in tourism travel, which means tourists are swept away by trends and crowds, will increase the likelihood of behavioral consensus going to the current "hot" destination (Boto-García & Baños-Pino, 2022). Thus, it can be said that social influence can boost travelers' travel intentions when they receive positive signals from the community or restrain them if they encounter negative opinions.

H6: Social influence has an impact on travel destination choice intention

2.3.7 Tourist behavioral intention

Tourist behavioral intention is understood as the level of willingness and conscious plan of travelers to choose or visit a destination in the near future, and they are often studied in the form of destination choice intention, revisit intention, recommendation intention or loyalty. In particular, destination choice intention is one of the most commonly studied forms because it is close to the traveler's initial decision about the destination in their itinerary, which expresses the desire or ability that the traveler intends to choose a certain destination (e.g., Hoi An) in their future journey. High-intent travelers are more likely to translate into actual behavior if conditions are favorable.

Applied in the context of tourism or destinations, studies applying TPB to the intention of choosing a destination show that attitudes, subjective norms, and PBC are all predicted to have a meaningful intention to choose (Lam & Hsu, 2006). In addition, some recent studies emphasize that in addition to traditional factors (psychological, social), external factors (destination image, infrastructure, cost, social influence, communication technology) also influence travel intentions, for instance, study examine the ways in which social, cultural, personal and psychological factors guide the choices of Azerbaijani domestic tourists among destinations with varying levels of attractions, services, ease of access, destination image, pricing and human resources - *Factors influencing local tourists' decision-making of on choosing a destination: A case of Azerbaijan* (Seyidov & Adomaitienė, 2017b), or a study on Tourist behavior: *The role of digital marketing and social media* (Armutcu et al., 2023), or a new study work on how information quality affects behavioural intention - *The impact of information quality on behavioral intention:*

New insights from North African tourism sector (Shneikat et al., 2025). Scholars argue that understanding the decision-making process of tourists not only helps to explain needs and motivations but is also the basis for building an effective marketing strategy for the destination (Smallman & Moore, 2010).

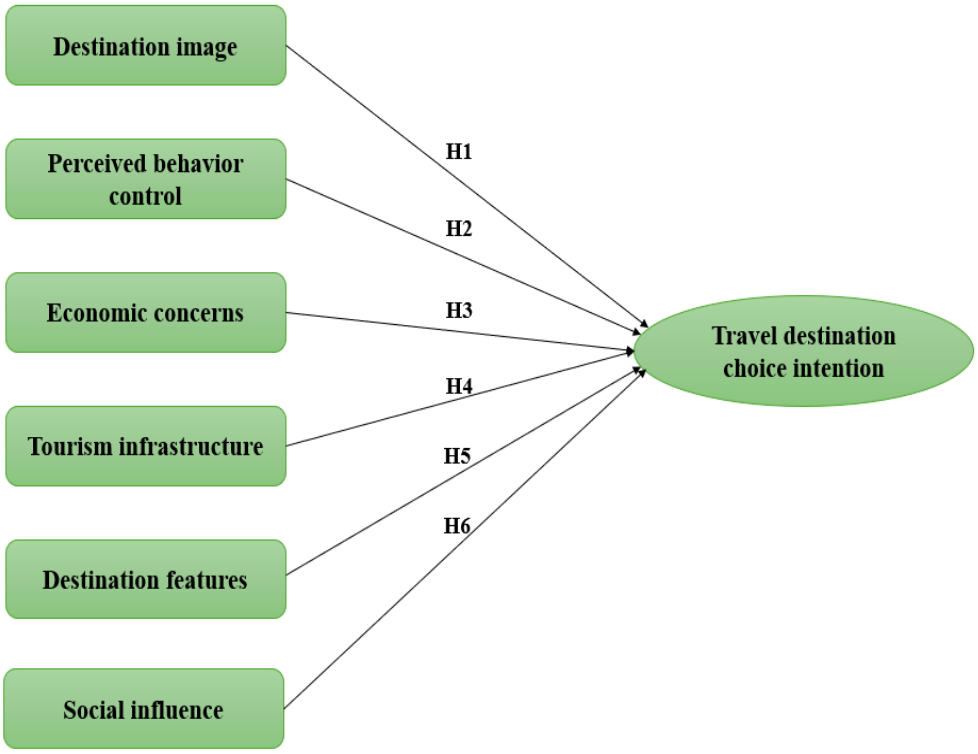

Figure 5. Research model

3 CHAP 3: METHODOLOGY

3.1 Quantitative Research

The project employs a quantitative design with a cross-sectional design and collects primary data using a structured questionnaire as the main instrument. This approach is in line to measure the relationship between variables and ensure the standardization of measurements to test H1-H6 hypotheses on the impact of destination imagery, destination characteristics (migration, cuisine, festivals), tourism infrastructure, perceived behavioral control, economic concerns, and social influences on the intention of Vietnamese tourists to choose Hoi An. This questionnaire allows access to a large number of participants distributed in various geographies at the cost and time of signing,

thereby improving the reliability and generalization of the results. The questionnaire is structured into sections: refining (gender; age; being a Vietnamese citizen; income; frequency of travel; spending level; visited, currently visiting, and intend to visit Hoi An in the next 12 months), a scale of research variables and minimum demographic information. In addition, to reduce general methodological bias, this study is anonymous and used for academic purposes only, emphasizing that there are no "right-false" answers. After collection, the data were cleaned and analyzed using the PLS-SEM model to quantify the relative impact intensity between the structures, providing quantitative evidence for Hoi An destination management and marketing.

3.2 Measurement

To measure the study structures, 34 observational variables adjusted from previous studies of travel behaviour and TPB were used. Specifically, the expected scale includes: Destination image (perception–emotion, 5 variables), Destination features (nature–culture–event, 7 variables), Tourism infrastructure (6 variables), Perceived behavioral control (5 variables), Economic concerns (3 variables), Social influences (4 variables), Travel destination choice intention (4 variables). Observational variables are measured using a 5-point Likert scale (1= Strongly disagree, 2= Disagree, 3= Neutral, 4= Agree, 5= Strongly agree) to ensure ease of understanding when answering on mobile devices and at the survey site, while ensuring the measurement sensitivity and distinction required for model analysis.

Before the official release, the questionnaire with the reference item comparison table will be sent to the instructor to verify the validity of the content of each item, ensuring that the instrument reflects the correct concept to be measured. The scale is evaluated based on the criteria of relevance, clarity, translation content that closely follows English sources and comprehensiveness. In the official survey, reliability and measurement value will be evaluated according to the PLS-SEM standard: Outer loadings, Cronbach's Alpha, Path Coefficient, Composite Reliability, AVE, Fornell-Larcker Criteriation, HTMT, VIF, R-square and F-square.

3.3 Sampling design

The study subjects are Vietnamese citizens who visited or intend to choose Hoi An as a tourist destination in the next 6–12 months for tourism purposes. The first section of the questionnaire includes basic questions on respondents' socio-demographic characteristics and travel behavior. In the demographic characteristics section, define gender, age, education and income. In terms of travel behavior, the questions show frequency and average spending for trips and important factors when choosing Hoi An for tourism, which are affected by cultural, social or human factors. The second part of the questionnaire focused on addressed destination preference questions and asked respondents to rate how important each specified factor was in their decision-making. These were divided into 6 factors: destination image, perceived behavioral control, economic concerns, destination features, tourist infrastructure, and social influences. The outreach framework consists of two channels, namely online (social media, tourism communities and surveys) and in Hoi An (old town, attractions). The data was collected for analysis by direct survey in the provinces and cities of Vietnam, the sample selected for the study was a non-probability sampling and the target sample size was at least 300.

3.4 Questionnaire

Factors	Questionairs	Sources
Destination image (DI)	The Hoi An destination has attractive historic and cultural sites	(LE et al., 2023)
	It is easy to visit historical and tourist places in the Hoi An destination	
	The level of service quality is excellent	
	The residents of the Hoi An destination are friendly	
	Hoi An's destination created many pleasures	
	I have enough money when I go to travel to Hoi An City	(LE et al., 2023)

Perceived Behavior Control (PBC)	I have much information to select the Hoi An destination	
	I have enough stamina to take part in tourism	
	To participate in traveling to Hoi An City, I have enough time	
	I can afford to use e-banking.	
Social influence (SI)	The popular thinking in society is to travel to Hoi An City	(LE et al., 2023)
	People who are important to me would like to travel to Hoi An City	
	My colleagues would think I should travel to Hoi An City	
	My friends would think I should travel to Hoi An City	
Economic concerns (EC)	A destination that will suit my household budget	(Mutinda & Mayaka, 2012)
	A destination that would provide value for holiday money	
	The best economic deal I could get	
Destination features (DF)	Interesting rural countryside	(Mutinda & Mayaka, 2012)
	Exotic atmosphere	
	A place that is easy to access	
	Standards of hygiene and cleanliness of the destination	
	Unpolluted environment	
	Outstanding scenery	
	Buildings and places of historical or archaeological importance	
	Outdoor activities	

	Nice weather	
Tourism infrastructure (TI)	Cost of transportation	(Seyidov & Adomaitienė, 2017)
	Price of accommodations and F&Bs	
	Condition of transportation	
	Availability of important information about accommodations and F&Bs	
	Quality of service in accommodations and F&Bs	
	Diversity of accommodations and F&Bs	
Travel destination choice intention (TI)	Hoi An is the city that I want to travel to	(LE et al., 2023)
	I intend to go to Hoi An City shortly	
	In the future, I intend to go to Hoi An City whenever I have a travel	
	I shall recommend the Hoi An destination to others	

3.5 Data collection

Survey data were collected from September to November 2025, using a combination of online and in-person methods through the official data collection method, which involved surveying via Google Forms using a pre-prepared question form with a variety of refinement questions. In the online form, the link and QR code of the form are issued and the survey is invited via social networks, the tourism and surveys community. At the same time, the study conducted a direct survey at a number of attractions in Hoi An (old town, Cau Pagoda, night market) using QR codes so that survey participants could easily fill in themselves on their mobile devices. The form opening page states academic purposes, commitment to anonymity, non-collection of personal data, and screening questions. After the end of the collection, the data is cleaned, the record type is inqualified,

abnormal in answers, or shows signs of copying; underprocessing of data at an appropriate level and multivariate alien testing before inclusion in analysis.

With the implementation of the survey, the study collected over 450 forms. After the filtering process, the sample does not meet the criteria, such as having multiple items in the screening question that have more answers than specified, or unreliable answers such as constantly selecting one answer for all questions. The results after being reviewed and eliminated, eventually obtained 433 samples with relevant and satisfactory feedback that were used for analysis.

3.6 Data analysis

The analysis is performed using SmartPLS 4.1.1.6 (PLS-SEM model). The analysis began with descriptive statistics (frequency, rate, mean) to characterize the sample by gender, age, income, travel frequency and attractive characteristics of the Hoi An destination. Next, the PLS-SEM model was estimated using SmartPLS to determine the reliability and validity of each indicator and scale, and test the relationships between latent variables.

In the reflection measurement model, if the outer loadings variable is 0.7 or above, the observed variable is guaranteed to be reliable (Vincenzo Esposito Vinzi et al., 2010). Furthermore, Composite Reliability, like Cronbach's alpha, is a measure of the reliability of a reflective structure, but it includes the actual factor loadings while alpha uses equal weights, with values in the range of $1.0 > CR \geq 0.7$ generally considered acceptable. Additionally, when AVE is 0.5 or greater, check the differential value using the Fornell–Larcker and HMTM criteria (threshold <0.85–0.90) (John Hulland, 1999).

In the structured model, Collinearity statistics (VIF) values, Path Coefficient via bootstrapping (e.g. 5,000 repeated samples), R^2, f^2 reports are used to evaluate the forecasting capacity outside the sample. The results allow us to confirm or disconfirm the hypotheses, clarify the relative influence of each factor on the intention to choose Hoi An, and draw management implications for the marketing strategy – destination management

4 CHAPTER 4: RESULTS AND DISCUSSION

4.1 Descriptive statistics

Table 1. Descriptive statistics of respondents

Measure	Value	Frequency	Percent
Gender	Female	255	58.89
	Male	178	41.11
Age	45+	31	7.16
	From 35 – 44	45	10.39
	From 25 - 34	80	18.48
	From 18 - 24	250	57.74
	Under 18	27	6.24
Education	University	287	66.28
	College	40	9.24
	Postgraduate	68	15.70
	High school	32	7.39
	Other	6	1.39
Income	Less than 5 million VND	202	46.65
	5-10 million VND	116	26.79
	10-20 million VND	87	20.09
	Above 20 million VND	28	6.47
Frequency of	Less than 1 time/year	102	23.56
	1 - 2 times/year	219	50.58

travel/year (domestic & international)	3 - 4 times/year	77	17.78
	More than 4 times/year	35	8.08
Average spending on a trip (unit: VND)	Less than 3 million	119	27.48
	3 - 5 million	149	34.41
	5 - 10 million	119	27.48
	Over 10 million	46	10.62

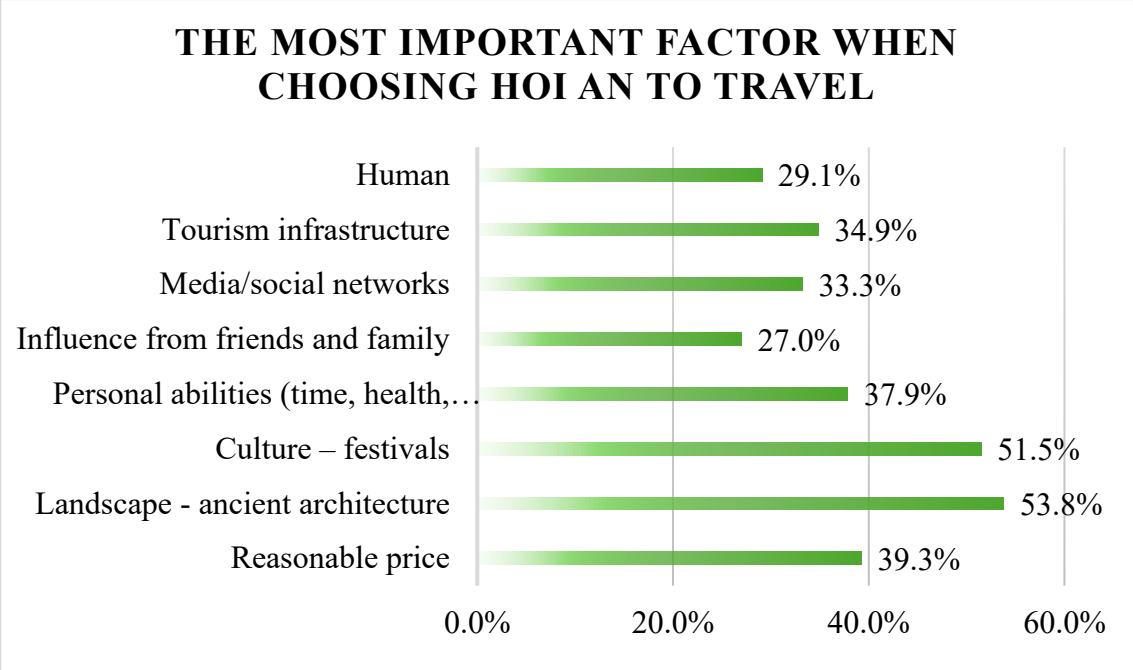

Figure 6. The most important factor for choosing a destination - Hoi An

The statistical results described in **Table 1** show that the research sample structure is relatively young and highly educated. The gender distribution of survey participants showed that females accounted for 58.89% higher than 41.11% of males, indicating that female tourists were more interested in and willing to participate in the survey about Hoi An tourism. In terms of age, the age group from 18 – 24 accounts for the largest proportion with 57.74%, followed by the group of 25 – 34 years old (18.48%), while the rest of the

groups only account for a small percentage. Along with that, the rate of having undergraduate and postgraduate degrees is very high (over 80%), showing that this is a group of tourists with good education and access to information. Moreover, in terms of education level, the number of participants with university degree accounted for a significant proportion of over 66% in the sample mainly students, followed by 15.7 % who have postgraduated, showing that this is a group of tourists with good education and a fairly high ability to access and evaluate information. Economically, most of them belong to the middle-low income group (less than 10 million VND/month), but most still travel 1-2 times a year and spend about 3-5 million VND per trip. Thus, it can be said that the research sample focuses on the young domestic visitor segment, with a moderate budget but stable experience demand.

Besides, the most important factor that drives the intention when choosing Hoi An shows quite clear compatibility. The group of young tourists who have a hobby of exploring have a high appreciation for landscape – ancient architecture with 53.8% and culture – festivals with 51.5%, that is, most of them will be strongly attracted by the deep heritage values and characteristics of Hoi An ancient town. The reasonable price was chosen by 39.3%, which reflects the cost sensitivity of this group of guests. In addition, factors such as personal abilities (time, health, information, finances), tourism infrastructure and media/social networks are also highly appreciated, which shows that besides heritage resources, ensuring convenient services and effective promotion are necessary conditions to translate needs and intentions into real decisions when choosing a destination in Hoi An.

4.2 The measurement model

Beyond assessing the general suitability of the model, the study conducts verification of the measurement model to verify that the scales used are both reliable and valid. In particular, the reliability of the indicators and the validity of the latent constructs are assessed so that poorly performing items can be removed and only those that adequately capture the underlying concepts are retained. The criteria for reliability indicators, internal consistency, convergent validity, and discriminant validity are based on the guidelines suggested by (Hair et al., 2017). The evaluation follows the commonly

recommended standards in PLS-SEM for reflective modeling, including Outer loadings, Cronbach's alpha, Composite Reliability, and Average Variance Extracted (AVE).

Table 2. Outer loadings

	DF	DI	EC	PBC	SI	TI	TIN
DF1	0.733						
DF2	0.721						
DF3	0.718						
DF4	0.710						
DF5	0.713						
DF6	0.726						
DF7	0.741						
DF8	0.703						
DF9	0.704						
DI1		0.772					
DI2		0.767					
DI3		0.789					
DI4		0.742					
DI5		0.797					
EC1			0.800				
EC2			0.832				
EC3			0.799				
PBC1				0.839			
PBC2				0.816			
PBC3				0.834			
PBC4				0.813			
PBC5				0.865			

SI1					0.806		
SI2					0.872		
SI3					0.874		
SI4					0.888		
TI1						0.918	
TI2						0.916	
TI3						0.888	
TI4						0.900	
TIN1							0.734
TIN2							0.776
TIN3							0.717
TIN4							0.738
TIN5							0.730
TIN6							0.724

First, according to (Hair et al., 2017) outer loadings of at least 0.70 are generally required for an indicator to be considered acceptable. As reported in **Table 2** all indicators in the measurement model meet or exceed this benchmark, indicating satisfactory reliability and convergent validity. Specifically, the constructs, including EC, PBC, SI, and TI, exhibit especially strong performance, with most indicators loading above 0.80, which underscores the appropriateness of these items and their substantial contribution to the underlying latent variables. The others, such as DF, DI, and TIN, also meet over the threshold, although items such as DF8 (0.703) and DF9 (0.704) are just at an acceptable level, which shows that this research still has elements to refine or re-evaluate in future studies. Overall, the external loads confirmed the reliability of the model, and all structures exhibited a full connection to their items, contributing to a strong and consistent measurement model.

Table 3. Construct reliability and validity				
	Cronbach's alpha	**Composite reliability (rho_a)**	**Composite reliability (rho_c)**	**Average variance extracted (AVE)**
DF	0.883	0.884	0.906	0.517
DI	0.832	0.834	0.882	0.598
EC	0.739	0.740	0.852	0.657
PBC	0.890	0.892	0.919	0.695
SI	0.882	0.883	0.919	0.740
TI	0.927	0.927	0.948	0.820
TIN	0.831	0.833	0.877	0.543

In addition, evidence from Cronbach's alpha, composite reliability and the average variance extracted (AVE) indicates that the measurement model achieves adequate internal consistency and convergent validity. Cronbach's alpha coefficients values ranged from 0.739 (EC) to 0.927 (TI), both of which exceeded the 0.70 threshold, which is considered good for exploratory and applied research. The composite reliability (both rho_a and rho_c) of the concepts is in the range of 0.852–0.948, which is higher than the minimum threshold of 0.70 but lower than 0.95, implying that the scales are both consistent and not over-informed. As such, the measurement model exhibits very high reliability in all potential structures. Another standard criterion for determining convergent validity at the construct level is AVE and AVE is above the minimum required level of 0.5 (Hair et al., 2017). (AYBEK & KARAKAŞ, 2022) shows that the structure explains more than half of the variance of the indicators, i.e., the scale converges well into the concept to be measured. From **Table 3**, the AVE values for all constructs all exceed 0.50: DF = 0.517; DI = 0.598; EC = 0.657; PBC = 0.695; SI = 0.740; TI = 0.820; TIN = 0.543. Thereby, it can be concluded that the scales in the study all achieve convergent validity.

Table 4. Discriminant validity – Fornell-Larcker Criteriation							
	DF	**DI**	**EC**	**PBC**	**SI**	**TI**	**TIN**
DF	0.719						
DI	0.759	0.774					
EC	0.686	0.595	0.811				
PBC	0.768	0.705	0.651	0.833			
SI	0.688	0.621	0.586	0.696	0.860		
TI	0.812	0.746	0.708	0.818	0.797	0.906	
TIN	0.739	0.683	0.693	0.734	0.668	0.775	0.737

Table 5. Discriminant validity – HTMT							
	DF	**DI**	**EC**	**PBC**	**SI**	**TI**	**TIN**
DF							
DI	0.882						
EC	0.850	0.756					
PBC	0.862	0.814	0.799				
SI	0.780	0.722	0.724	0.785			
TI	0.895	0.846	0.854	0.898	0.881		
TIN	0.862	0.819	0.883	0.851	0.778	0.881	

Discriminant validity was assessed using both the Fornell–Larcker criterion and the HTMT ratio. First, the Fornell–Larcker matrix shows the square root of the AVE of each concept in the range of 0.719–0.906, and most of them are greater than the correlation coefficients with the other concepts, demonstrating that each structure is clearly distinguishable from the others. However, there is still a slight weakness, which is that the square root of the AVE of DF (0.719) is less than some of the correlation

coefficients of DF with DI, PBC, TI, and TIN, suggesting that the differentiating value of DF compared to these concepts is not really strong. This result reflects that in the perception of tourists, destination facilities are often associated with destination image, perceived behavioral control and intention to choose Hoi An. For further verification, the HTMT matrix shows that all coefficients are below the acceptance threshold of 0.9, so the model still meets the requirement of differential values. Most pairs of variables have an HT in the range of 0.70–0.80, showing moderate relevance; some pairs such as DF–DI, DF–PBC, DF–TI, EC–TIN, TI–PBC have HTMT above 0.85 but still below 0.90, suggesting that these concepts are closely related but not to the point of overlapping. In general, other reliability indicators are still satisfactory, so the overall Fornell–Larcker results combined with HTMT still allow for the acceptance of the differential values of the scales, while noting that this is a minor limitation to be noted when interpreting the individual effects of each variable in the structural model.

4.3 The structural model

Table 6. Collinearity statistics VIF – inner model

	VIF
DF → TI	3.743
DI → TI	2.691
EC → TI	2.265
PBC → TI	3.234
SI → TI	2.314
TIN → TI	3.043

Before considering the hypotheses, the study evaluates the colinearity between the constructs using the Collinearity statistics (VIF) in the inner model. According to (Sohil et al., 2022), if VIF is greater than 5, there is a problem. As shown in Table 5, the VIF values of DF→TI (3,743), DI→TI (2,691), EC→TI (2,265), PBC→TI (3,234), SI→TI

(2,314), and TIN→TI (3,043) are all below the threshold of 5, suggesting that no multicollinearity causes estimation bias in the model.

Table 7. Summary of hypothesis tests

	Original sample (O)	Sample mean (M)	Standard deviation (STDEV)	T statistics (|O/STDEV|)	P values
H1: DI → TI	0.116	0.116	0.036	3.244	0.001
H2: PBC → TI	0.239	0.241	0.042	5.643	0.000
H3: EC → TI	0.108	0.107	0.033	3.316	0.001
H4: TIN → TI	0.119	0.118	0.039	3.087	0.002
H5: DF → TI	0.175	0.174	0.040	4.361	0.000
H6: SI → TI	0.297	0.297	0.037	8.067	0.000

The results of the study showed that Destination Image had a positive and meaningful effect on travel destination choice intention with a coefficient of $\beta = 0.116$, $p = 0.001$. This reflects the important role of destination image in the process of shaping the intention to choose Hoi An. When visitors form a positive impression of Hoi An's landscape, culture, ancient urban space and heritage values, they tend to develop a desire to experience the local reality. This result is consistent with the research on tourism that creates Hoi An, affirming that the image of the destination contributes to improving positive emotions and is statistically significant to the travel intentions of tourists of (LE et al., 2023). In the context of Hoi An, DI has become an important platform because the ancient city carries heritage values and makes a difference compared to other destinations. The results reinforce the perception that landscape conservation, maintaining cultural identity and increasing destination communication continue to enhance DI and thereby promote visitor TI.

Moreover, Perceived Behavioural Control has a strong influence and has a significant contribution to Travel destination choice intention with a coefficient of β =

0.239, $p < 0.001$. This shows that tourists feel easy access to Hoi An based on their sense of autonomy during the trip, including cost, information, time and access to financial services, thereby increasing their willingness to choose a destination. The results are consistent with studies using the Theory of Planned Behavior, where PBC is often the dominant predictor of intention. However, the (LE et al., 2023) study showed that PBC had no effect and was excluded from the model. This difference reflects differences in the sample audience and the survey context. That article focuses on international travelers, groups of tourists who often rely on tours, guides, packages or available plans, so the level of autonomy during the trip does not have a strong influence on their decisions. In contrast, this study focuses on Vietnamese tourists, who have access to a variety of information in the country and are more likely to participate in self-sufficient or self-planned travel. Therefore, PBC becomes a meaningful factor, which shows that PBC is "context dependent", which can vary according to the type of traveler and the level of familiarity with the destination.

Furthermore, Economic Concerns ($\beta = 0.108$, $p = 0.001$) have a positive and meaningful influence on choosing destination intentions, reflecting that travellers pay attention to costs, expected spending levels and financial capabilities before deciding to visit Hoi An. This is consistent with studies on travel behaviour, in which economic factors play a role in supporting the decision of tourists, especially in destinations with high price competitiveness. This is different from (Cao Thi Cam Huong, 2024) research where economic issues have a negative impact on the intentions of tourists. Therefore, it can be seen that the EC difference is not always the deciding factor, but also depends on the traveler segment and the survey context.

Next, Tourism Infrastructure has a positive impact with a coefficient of $\beta = 0.119$, $p = 0.002$. Tourism infrastructure plays a key role because tourists often prioritize destinations with convenient transportation, diverse accommodation services, clear signage and a full system of supporting utilities. When tourists feel that the infrastructure in Hoi An meets their travel and experience needs, they will increase their willingness to choose this destination. Similar to the results of (Nguyen et al., 2025) research, infrastructure is also identified as an important factor, but the impact is stronger than the results of this article, it directly contributes to the competitiveness of destinations. In the

context of an ancient city like Hoi An, the role of TIN is even more obvious because of the large number of visitors and narrow space. This requires reasonable investment in connected transportation, visitor navigation systems, public services, and tourism-assisted technology. As TIN grows, TI will continue to increase in a sustainable trend.

Besides, Destination Features shows a strong level of influence with a coefficient of $\beta = 0.175$, $p < 0.001$. DF reflects the core characteristics of the destination such as cultural values, architecture, experiences, weather and signature activities. When travelers appreciate these factors, they are more likely to form a bond and a desire to explore. Hoi An possesses unique cultural and historical advantages, so DF has a more obvious impact than many other destinations. Research by (Mutinda & Mayaka, 2012) also confirms the role of DF in forming positive attitudes and promoting intentions. In particular, the research of (Seyidov & Adomaitienė, 2017) that environmental characteristics are also considered one of the important factors when choosing a destination. For Hoi An, DF includes ancient house architecture, lantern streets, intangible cultural heritage, traditional activities such as floating lanterns or participating in crafts and fresh air. As these elements continue to be preserved and upgraded, DF will maintain its ability to attract visitors and play a key role in increasing TI.

Finally, Social Influence was the strongest factor in the model with a coefficient of $\beta = 0.297$, $p < 0.001$. SI reflects the impact of friends, family, online communities and social media on destination decisions. In the context of travelers relying heavily on real reviews and sharing experiences from others, SI has a strong effect on TI. Research from LE et al. (2023) shows that social influence is a direct and leading factor in predicting travel intent, especially when users are exposed to content from their community or people they trust. Hoi An often appears on social networks through images of the old town, lanterns, cuisine and typical cultural activities. When visitors consistently see positive sharing, they form a belief and desire to experience. This suggests that Hoi An should strengthen social media, encourage user-generated content, and partner with the right influencers. SI thus becomes a strategic tool to expand destination coverage and promote IT in both the short and long term.

Table 8. R-square		
	R-square	**R-square adjusted**
TI	0.828	0.826

According to (Henseler et al., 2009), R^2 with a value of 0.25, 0.5, or 0.75 for endogenous latent variables can be described as weak, moderate, or substantial. The R-square value of the model reached 0.828 and the corrected R-square reached 0.826. This is a very high level in travel behavior studies, which shows that the model indicates about 82.8% of the variation of Travel destination choice intention (TI), it exhibits good model quality and confirms a high degree of fit between the independent variables and the TI.

Table 9. F-square							
	DF	**DI**	**EC**	**PBC**	**SI**	**TI**	**TIN**
DF						0.047	
DI						0.029	
EC						0.030	
PBC						0.103	
SI						0.222	
TI							
TIN						0.027	

Based on the model results in **Table 9**, variables with high impact coefficients such as SI and PBC often achieve f^2 in the medium to large range, suggesting that these two factors make a significant contribution to TI prediction. Variables such as DI, TIN, and DF often record small to moderate f^2, reflecting that despite their statistical significance, their contribution to the overall model is not as strong as that of SI and PBC. This makes sense because these variables primarily impact destination perceptions, not directly

leading to decisions. EC in particular often shows a small f^2, which implies that the EC only plays a supporting role in raising the TI, not the main driver.

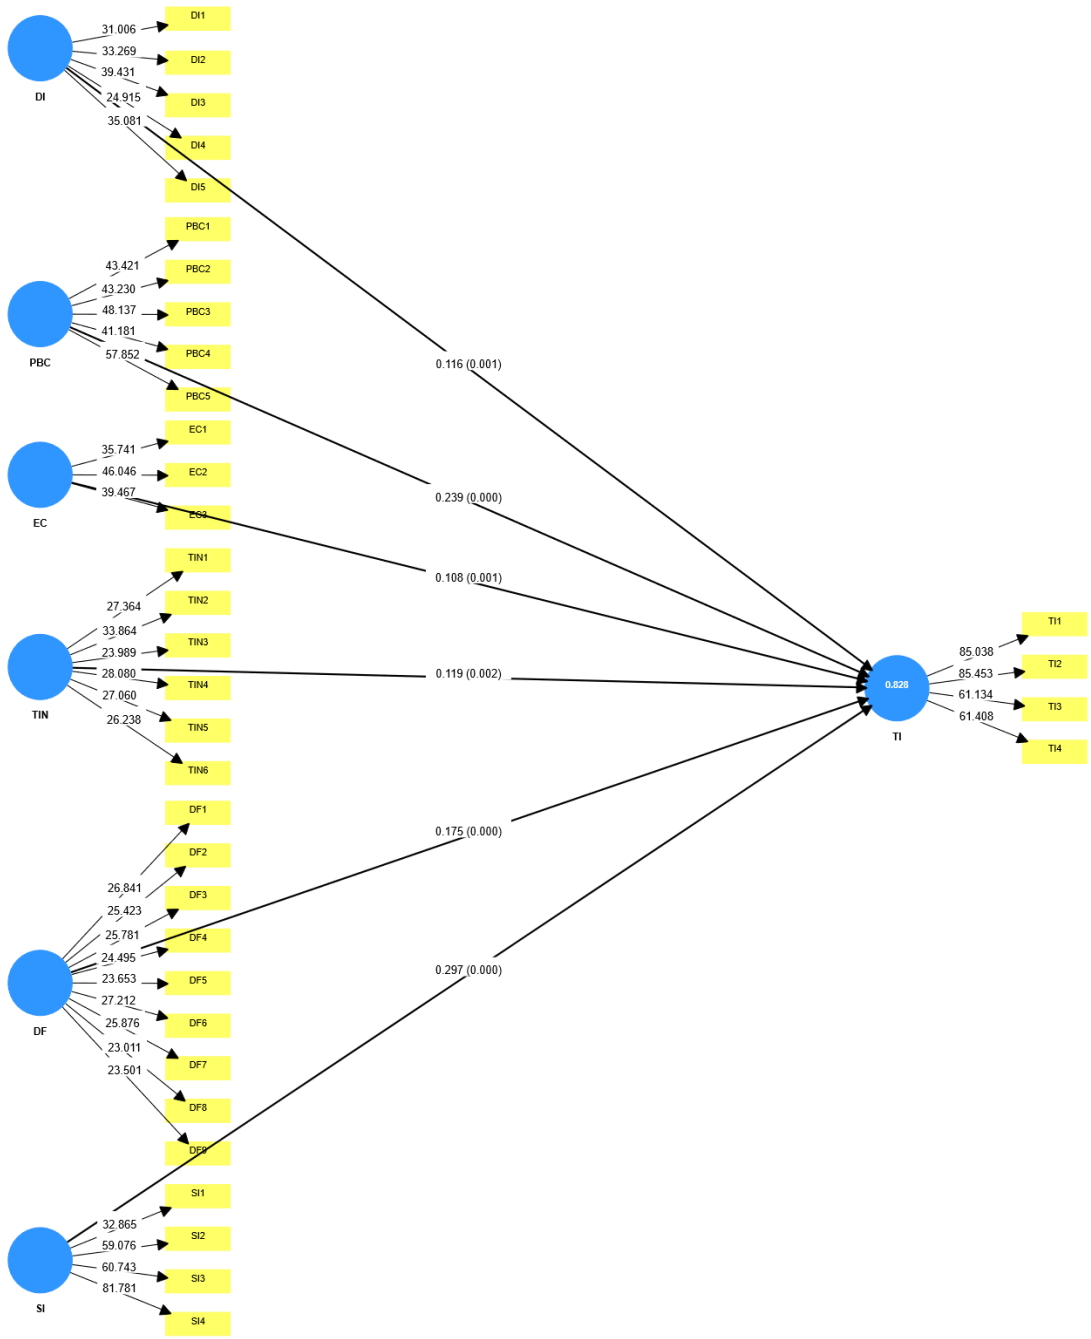

Figure 7. Results of the structural model

5 CHAPTER 5: CONCLUSION AND IMPLICATIONS

5.1 Summary findings

The study "Determinants of travel destination choice intention among Vietnamese tourists: The case of Hoi An World Cultural Heritage Site" was conducted with the goal of identifying and measuring the factors affecting the intention of Vietnamese domestic tourists to choose Hoi An. Based on a dataset of 433 valid questionnaires and analyzed using the PLS-SEM model with six independent variables (Destination Image, Destination Features, Tourism Infrastructure, Perceived Behavioral Control, Economic Concerns, Social Influence) and the dependent variable Travel Destination Choice Intention was validated. The results of the measurement model analysis showed that the scales were reliable and the outer loadings of the basic observed variables were greater than 0.7; Cronbach's alpha and Composite Reliability > 0.7; AVE > 0.5. The model explained 82.8% of the variation in destination selection intention ($R^2 = 0.828$), suggesting a very high level of relevance in the context of travel behavior research. The value of differentiation is ensured through the Fornell–Larcker and HTMT criteria, although some variables such as Destination Features, Destination Image and Travel destination choice intention appear relatively high correlations, reflecting the fact that in the perception of travelers, destination characteristics are often closely associated with destination image and intention to choose.

The results of the hypothesis test demonstrate that all 6 factors have a positive and statistically significant impact on the intention to choose Hoi An. In particular, Social Influence is the most influential factor, followed by PBC, DF, TIN, DI and finally EC. This shows that the intention to choose Hoi An of Vietnamese tourists is not the result of a single factor, which is a combination of impressions of the destination, heritage – experience characteristics, infrastructure conditions, a sense of autonomy during the trip, pressure – social trends and financial considerations.

Compared to previous studies, DI in this thesis continues to affirm its positive role, similar to (LE et al., 2023) results on Hoi An image and travel intentions but not the strongest dominant factor when placed next to SI and PBC. In addition, PBC clearly shows "context dependence", while (LE et al., 2023) research on international visitors shows that

PBC is not meaningful and is excluded from the model, for the sample of Vietnamese tourists who are familiar with the destination, have easy access to information and often travel independently, PBC has become an important forecasting factor. The EC has a positive but small impact, in contrast to Cao Thi Cam Huong's (2024) research, where economic factors have a negative impact, suggesting that costs can be a barrier or a driver depending on the customer segment and the value structure they perceive. TIN still plays an active role, but its influence is lower than Nguyen et al. (2025) research, suggesting that in the context of Hoi An, infrastructure is a fundamental condition but not enough to create intentions without heritage characteristics and social effects. DF is consistent with the conclusions of (Seyidov & Adomaitienė, 2017b) on the role of destination attributes in the formation of attitudes and intentions. Most prominently, SI coincides with (LE et al., 2023) findings that the impact of family, friends, online communities, and social media content is the most powerful "lever" that shapes TI. Overall, the intention of Vietnamese tourists to choose Hoi An is the result of a combination of psycho-social factors, destination awareness and economic considerations, of which Social Influence and Perceived Behavioral Control are the two key factors. The model of the thesis has just strengthened the previous results, showing the contextual differences between international and domestic visitors, especially in the two factors of PBC and EC, thereby emphasizing the specificity of Vietnam's domestic tourism in the current period.

5.2 Implications

Theoretically, the research contributes to the expansion of the application of Theory of Planned Behavior (TPB) in the context of domestic tourism in a heritage destination in Vietnam. The experimental results show that Perceived Behavioral Control and Social Influence play a prominent role in predicting destination selection intentions, in line with TPB's argument when considering intention as a bridge between attitudes, subjective norms, behavioral control perceptions and actual behaviors. At the same time, the study integrated important exogenous factors in tourism such as destination image, destination characteristics, tourism infrastructure and economic concerns into the same model as PBC and social influence. This approach enriches the empirical evidence for the stream of research on destination image and tourist behavioral intention, and shows the importance of combining "soft" factors (images, experiences, social influences) with

"hard" factors (infrastructure, cost) in the context of heritage tourism in emerging markets. In addition, PBC results are significant in the sample of Vietnamese tourists but not in the study of international visitors, so in the following studies, TPB can be further exploited in different market segments such as Gen Z, families, elderly visitors, and MICE visitors to better understand the diversity of tourism behavior.

In practical terms, the results of the study have many important implications for local governments, destination management agencies as well as tourism and service businesses in Hoi An, which become even clearer in the context of the current Vietnamese tourism market. After reopening, Vietnam's tourism has recovered very quickly. In 2024, it will welcome more than 17.5 million international visitors, reaching approximately 98% of the pre-pandemic level, while domestic tourism will exceed 110 million arrivals with a revenue of more than 884 trillion VND, surpassing 2019 (Ngoc Hoang, 2025; Việt Nam News, 2025). At the same time, international reports show that world tourism is also approaching a full recovery, but the economic context and the cost of living are still important barriers to tourism demand (UN Tourism, 2023; UNWTO, 2025). In this picture, Hoi An is one of the "symbols" of Vietnam's tourism, both a World Cultural Heritage Site and a destination that is continuously honored by international media and digital platforms. However, it also faces new risks such as recent natural disasters that caused flooding and disrupted tourism activities, forcing the city to restore infrastructure and services under time pressure (Reuters, 2025). That makes understanding the motivations and barriers in the intention of domestic visitors to choose Hoi An especially important for policy making and market strategies.

First of all, the fact that Social Influence is the factor that has the strongest influence on the intention to choose Hoi An reflects the market reality for Vietnamese tourists, especially Gen Z who increasingly rely on social networks, reviews and practical experience content when deciding on destinations. Recent studies on Gen Z in Vietnam show that the quality of information, advertising, WOM, and the usefulness of content on social networks all have a positive impact on the travel intentions of this group of visitors (Trương et al., 2023). This shows that destination communication and marketing strategies need to focus more on exploiting the power of social networks, online communities and e-WOM. At the same time, many domestic and foreign projects affirm that TikTok,

Instagram, and short videos are becoming new "search engines" and "travel guides", directly affecting the discovery of destinations and forming the trend of "following the trend" (Zheng et al., 2025). Therefore, Hoi An needs to consider digital media and online communities as the pillars of marketing strategy. Campaigns to promote Hoi An should be strongly implemented on platforms such as Facebook, TikTok, Instagram, YouTube combined with promoting user-generated content, organizing programs, photo and video contests or check-in activities with unified hashtags to increase the spillover effect. Selective cooperation with KOLs, KOCs, travel bloggers with followers that are suitable for the young and experience-loving Vietnamese tourist segment is also a potential direction to amplify the image of Hoi An as a destination that is both "traditional" and "trendy". If SI is the strongest "leverage", then communication policies and strategies should be designed so that every visitor leaving Hoi An tends to share positive experiences online.

Next, Perceived Behavioral Control has the second strongest impact, which is also in line with the trend of "journey autonomy" of Vietnamese tourists. Recent market studies indicate that Gen Z and younger groups of travelers see travel as an essential need, prefer unique experiences, but still carefully consider affordability, safety and convenience. Therefore, to increase PBC, the government and businesses in Hoi An need to improve the sense of "easy to go, easy to experience, easy to control and low risk" of tourists when thinking about Hoi An, through suggesting specific schedules according to each budget, providing centralized, complete and transparent information on transportation methods, sightseeing maps, ticket prices, opening hours, festival schedules, heritage conservation regulations on official channels; developing a portal or smart travel application that integrates itinerary suggestions according to the number of days and budget. When travelers feel that they are confident in "mastering" the journey to Hoi An from information, transportation, booking, ticketing, scheduling visits to estimated costs and time, the likelihood of moving from intention to actual decision will be much higher.

For Destination Features and Destination Image, it shows that Vietnamese tourists come to Hoi An not only to "check-in lanterns" but also to be attracted by the sum of ancient architecture, tangible and intangible heritage values, local cuisine, festivals, and the atmosphere of the old riverside town. However, to translate this attraction into actual

intentions and behaviors, it is necessary to design products and experiences with more depth, for example, shifting from the mindset of "selling tickets to visit the old town" to "designing themed experiences" such as night heritage tours combined with boats on the river, floating lanterns, enjoying folk art; experience traditional crafts like making lanterns, cooking traditional dishes; programs to connect communities and products in combination with neighboring craft villages and rural areas such as Thanh Ha pottery village and Kim Bong carpentry village. In parallel with landscape preservation, controlling excessive commercialization, retaining the "quality" of the old town while still meeting modern needs is a long-term problem to maintain a different destination image. At the same time, the results of Tourism Infrastructure also suggest that investment in tourism infrastructure in Hoi An does not only stop at upgrading roads, parking lots, and accommodation systems, but also needs to focus on "soft" infrastructure such as visitor flow planning, signboards, solutions to disperse visitor flows from overcrowded points, technology application in coordination and real-time information. In the era of TikTok and Instagram, where a viral video can lead to a large number of unexpected visitors, the story of infrastructure and traffic flow management is no longer just a technical issue, but has become a decisive condition for the destination to both develop and not "break the battle" as many cases around the world have warned (Angela Giuffrida, 2025).

Finally, although economic concerns are not the strongest factor, in the context that the majority of the study sample has an income of less than 10 million VND/month and an average expenditure per trip is about 3-5 million VND, the results show that the cost factor is still permanently present in the minds of tourists, instead of "is there enough money to go?" but "is the experience worth the money?". Therefore, instead of focusing only on discounts, local governments and businesses need to focus on pricing strategies in the direction of "value for money", designing accommodation – sightseeing – experience combo packages at reasonable prices for student groups, young people or young families; at the same time, emphasizing perceived value (heritage, culture, unique experiences) and ensuring price transparency to avoid negative impacts on E-WOM.

5.3. Limitations and future research

Despite achieving many meaningful results both theoretically and practically, the study still subject to certain limitations.

First of all, the sample structure tends to favor the younger group of tourists when the 18–24 age group accounts for nearly 58% and the 25–34 group accounts for nearly 19%, while the proportion of middle-aged and elderly groups is much lower. This makes the findings of the study reflect very clearly the picture of the young Vietnamese traveller segment – experience-loving, frequent use of social media, cost-sensitive – but may not be fully representative of the older or higher income groups, which are also potential audiences for Hoi An.

Secondly, the research design collected data over a short period of time (from September to November 2025), so it does not allow for the observation of changes in intentions and behaviors over time, by travel season, or by new communication and policy campaigns.

Third, the data of the study were collected through self-reported questionnaires, so it is difficult to avoid forms of bias such as cognitive bias or desirable social bias, when respondents tend to choose options that are considered more "reasonable" or "correct" than actual behavior.

Fourth, although the criteria of reliability and value are satisfactory, the correlation between some pairs of variables such as Destination Features, Destination Image and Travel destination choice intention shows that the conceptual boundaries in travelers' perceptions are somewhat intersecting and not completely separated.

Finally, the current model mainly considers the direct impacts from DI, DF, TIN, PBC, EC, SI to TI, without considering the role of intermediate variables such as satisfaction, perceived value, attachment to the destination, or regulatory variables such as travel experience, travel motivation, and personal cultural values.

From the above limitations, some suggestions for future research can be proposed. Further studies should expand the sample audience to be more balanced between age groups, regions and income levels among different segments of domestic tourists, and

collect data in batches to observe changes in intentions and behaviors to choose Hoi An over time, especially before and after major events, cultural festivals or destination media campaigns. In addition, the combination of qualitative methods like in-depth interviews or group discussions with travellers who have been there, are returning or only intend to visit Hoi An will help to clarify their perception of cultural authenticity, attachment to the destination and personal experience. In terms of theoretical models, future studies can add intermediate variables such as satisfaction, perceived value, destination attachment, loyalty and revisit intention, or regulatory variables such as travel experience, travel motivation, and cultural values to better understand the mechanism of impact of visual factors, characteristics, infrastructure, behavioral control, economic concerns, and social influences on choice intentions. Finally, the comparison between domestic and international visitors, between first-time and returning visitors, as well as the specific analysis of the role of eWOM and new social media platforms (TikTok, Instagram) in forming travel intentions will be potential directions and suitable for the context of digital transformation in the current tourism industry.

APPENDICES – QUESTIONNAIRE

FACTORS DETERMINING THE INTENTION OF VIETNAMESE TOURISTS TO CHOOSE A TRAVEL DESTINATION: HOI AN WORLD CULTURAL HERITAGE SITE

Dear friends,

My name is Thu Huong, a 4th-year student at the University of Finance and Marketing. Currently, I am in the process of conducting a graduation thesis research paper with the topic: "DETERMINANTS OF TRAVEL DESTINATION CHOICE INTENTION AMONG VIETNAMESE TOURISTS: THE CASE OF HOI AN WORLD CULTURAL HERITAGE SITE".

Hoi An Ancient Town, in the former Quang Nam province, now Da Nang city, has been recognized by UNESCO as a World Cultural Heritage Site since 1999. With its ancient architecture, unique cultural space, charming river landscape, rich cuisine and many traditional festivals, Hoi An has become one of the most attractive destinations in Vietnam.

Internal and external factors play an important role in the decision to choose a tourist destination, so the goal of the study is to understand the important factors that influence the decision to choose Hoi An by Vietnamese tourists, including:

- Destination image: impressions, feelings and visualizations of tourists about Hoi An.
- Perceived behavioral control: the ability and resources to make the trip (time, health, information, convenience).
- Economic concerns: costs, budgets, and price reasonableness.
- Tourism infrastructure: transportation, accommodation, services and supporting utilities.
- Destination features: landscape, architecture, cuisine, cultural and entertainment activities.
- Social influence: influence from family, friends, colleagues or social networks.

This survey is conducted completely anonymously; all information you provide is for scientific research purposes only, not for any commercial purposes, and the estimated response time is only about 5–7 minutes to complete.

Your contribution is extremely important and valuable, contributing to bringing accurate research results and empirical information on the factors affecting the intention to choose Hoi An destination of Vietnamese tourists.

SCEENING SECTION

1. Are you a Vietnamese citizen?

   Yes

   No

PERSONAL INFORMATION SECTION

1. What is your gender?
    - Male
    - Female
2. What age are you?
    - Above 45
    - From 35 – 44
    - From 25 – 34
    - From 18 – 24
    - Under 18
3. What is your education level?
    - High school
    - College
    - University
    - Postgraduate
    - Other
4. What is your monthly income (unit: VND)?
    - Less than 5 million
    - 5 – 10 million
    - 10 – 20 million
    - Above 20 million

Thank you very much for taking some valuable time for this survey.

APPENDICES – QUESTIONNAIRE VIETNAMESE VERSION

CÁC YẾU TỐ QUYẾT ĐỊNH Ý ĐỊNH LỰA CHỌN ĐIỂM ĐẾN DU LỊCH CỦA DU KHÁCH VIỆT NAM: DI SẢN VĂN HOÁ THẾ GIỚI HỘI AN

Thân chào bạn,

Mình là Thu Hương, là sinh viên năm 4 trường Đại học Tài chính-Marketing. Hiện tại mình đang trong quá trình thực hiện một bài nghiên cứu khoá luận tốt nghiệp với đề tài: **"CÁC YẾU TỐ QUYẾT ĐỊNH Ý ĐỊNH LỰA CHỌN ĐIỂM ĐẾN DU LỊCH CỦA DU KHÁCH VIỆT NAM: DI SẢN VĂN HOÁ THẾ GIỚI HỘI AN"**

Phố cổ Hội An, thuộc tỉnh Quảng Nam cũ, nay là thành phố Đà Nẵng, được UNESCO công nhận là **Di sản Văn hóa Thế giới** từ năm 1999. Với kiến trúc cổ kính, không gian văn hóa đặc sắc, cảnh quan sông nước hữu tình, ẩm thực phong phú và nhiều lễ hội truyền thống, Hội An đã trở thành một trong những điểm đến hấp dẫn nhất tại Việt Nam.

Các yếu tố nội tại và ngoại tại đóng vai trò quan trọng trong quyết định lựa chọn địa điểm du lịch, vì vậy mục tiêu của nghiên cứu là tìm hiểu những yếu tố quan trọng tác động đến quyết định lựa chọn Hội An của du khách Việt Nam, bao gồm:

- **Hình ảnh điểm đến (Destination image):** ấn tượng, cảm nhận và hình dung của du khách về Hội An.

- **Kiểm soát hành vi cảm nhận (Perceived behavioral control):** khả năng và nguồn lực để thực hiện chuyến đi (thời gian, sức khỏe, thông tin, sự thuận tiện).

- **Quan ngại về kinh tế (Economic concerns):** chi phí, ngân sách và sự hợp lý của giá cả.

- **Cơ sở hạ tầng du lịch (Tourism infrastructure):** giao thông, lưu trú, dịch vụ và tiện ích hỗ trợ.

- **Đặc điểm điểm đến (Destination features):** cảnh quan, kiến trúc, ẩm thực, hoạt động văn hóa – giải trí.

- **Ảnh hưởng xã hội (Social influence):** tác động từ gia đình, bạn bè, đồng nghiệp hoặc mạng xã hội.

Phiếu khảo sát này được thực hiện hoàn toàn **ẩn danh,** tất cả thông tin anh/chị/bạn cung cấp chỉ phục vụ mục đích nghiên cứu khoa học, không sử dụng cho bất kỳ mục đích thương mại nào, và thời gian trả lời dự kiến chỉ khoảng **5–7 phút** để hoàn thành.

Sự đóng góp của anh/chị/bạn là vô cùng quan trọng và quý báu, góp phần mang lại kết quả nghiên cứu chính xác và những thông tin thực nghiệm về các yếu tố ảnh hưởng đến ý định lựa chọn điểm đến Hội An của du khách Việt Nam.

CÂU HỎI SÀNG LỌC

1. Bạn có phải là công dân Việt Nam?
   Có
   Không

THÔNG TIN CÁ NHÂN

1. Giới tính của bạn
    - Nam
    - Nữ
2. Bạn đang trong độ tuổi nào?
    - Trên 45
    - Từ 35 đến 44
    - Từ 25 đến 34
    - Từ 18 đến 24
    - Dưới 18
3. Trình độ học vấn của bạn
    - Trung học phổ thông
    - Cao đẳng
    - Đại học
    - Sau đại học
    - Khác
4. Thu nhập hàng tháng của bạn (đơn vị: VNĐ)
    - Dưới 5 triệu đồng
    - Từ 5 - 10 triệu đồng
    - Từ 10 - 20 triệu đồng
    - Trên 20 triệu đồng
5. Tần suất đi du lịch trong năm (trong nước & quốc tế)
    - Ít hơn 1 lần/năm
    - 1 – 2 lần/năm
    - 3 – 4 lần/năm
    - Trên 4 lần/năm
6. Mức chi tiêu trung bình cho một chuyến du lịch (đơn vị: VNĐ)
    - Dưới 3 triệu đồng
    - 3 – 5 triệu đồng
    - 5 – 10 triệu đồng
    - Trên 10 triệu đồng
7. Trong các yếu tố sau, đâu là yếu tố quan trọng nhất khi chọn Hội An để du lịch (chọn tối đa 2)
    - Giá cả hợp lý
    - Cảnh quan – kiến trúc cổ
    - Văn hoá – lễ hỗi
    - Khả năng cá nhân (thời gian, sức khoẻ, thông tin, tài chính)
    - Ảnh hưởng từ bạn bè, gia đình
    - Truyền thông/mạng xã hội
    - Cơ sở hạ tầng du lịch
    - Con người

NỘI DUNG KHẢO SÁT

Anh/ chị/ bạn hãy cho biết mức độ đồng ý hoặc không đồng ý theo từng nhận định dưới đây theo mức độ từ 1 đến 5:

1 - Hoàn toàn không đồng ý

2 - Không đồng ý

3 - Bình thường

4 - Đồng ý

5 - Hoàn toàn đồng ý

Yếu tố		Câu hỏi	1	2	3	4	5
Hình ảnh điểm đến	DI1	Hội An có nhiều di tích lịch sử và văn hoá hấp dẫn.					
	DI2	Việc tham quan các điểm du lịch và di tích lịch sử ở Hội An khá dễ dàng.
